2,2'-Iminobis(2-methylpropionitrile) (4) ${ }^{[1]}$ Acetone ( $71.2 \mathrm{~mL}, 970 \mathrm{mmol}$ ) was added to an ice-cold solution of $\mathrm{KCN}(78.1 \mathrm{~g}, 1.20 \mathrm{~mol})$ and $\mathrm{NH}_{4} \mathrm{Cl}(77.0 \mathrm{~g}, 1.44 \mathrm{~mol})$ in aq ammonia $(38 \%, 500 \mathrm{~mL})$ over 1 h and the solution was stirred at $25^{\circ} \mathrm{C}$ for 5 d . The solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 250 \mathrm{~mL})$, the combined organic layers dried over $\mathrm{MgSO}_{4}$, and the solvent was removed in vacuo. The residue was distilled under reduced pressure $\left(52{ }^{\circ} \mathrm{C}\right.$, 20 mbar ) to give 2-amino-2-methylpropionitrile ( $60.8 \mathrm{~g}, 720 \mathrm{mmol}$ ), which was then refluxed at $100^{\circ} \mathrm{C}$ under reduced pressure ( 50 ? 20 mbar ) for 3 d , and concentrated in vacuo to obtain pure $4(35.5 \mathrm{~g}, 48 \%, 235 \mathrm{mmol}) .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=1.72(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 1.62(\mathrm{~s}$, $\left.12 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$-NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=123.2(\mathrm{CN}), 49.0\left(C\left(\mathrm{CH}_{3}\right)_{2}\right), 29.0\left(\mathrm{CH}_{3}\right)$.

3,3,5,5-Tetramethylpiperazine-2,6-dione (2) ${ }^{[1]}$ 2,2'-Iminobis(2-methylpropionitrile) (17.1 g, $112 \mathrm{mmol})$ was added to $\mathrm{H}_{2} \mathrm{SO}_{4}(124 \mathrm{~mL})$ at $5{ }^{\circ} \mathrm{C}$ over 2 h and the solution was stirred at $25^{\circ} \mathrm{C}$ for 3 d . The solution was heated to $100^{\circ} \mathrm{C}$ for 1 h and left overnight at room temperature. ## S3. Synthesis of Peptides P1, P2 and P3

For the synthesis of peptides P1, P2 and P3 low loaded ( $0.29 \mathrm{mmol} / \mathrm{g}$ ) Rink amide MBHA resin was used. The first amino acid was coupled three times using diisopropylcarbodiimide (DIC) and 1-hydroxybenzotriazole ( HOBt ) as coupling reagents. The proteinogenic amino acids were activated with HBTU/HOBt and DIEA and coupled using microwave irradiation. Fmoc-TOPP-OH (1) was activated with DEPBT and $\mathrm{NaHCO}_{3}$ in dry THF and coupled at 0 C for 2 h and then at $25^{\circ} \mathrm{C}$ for 30 min . Fmoc protecting group was cleaved by piperidine/DMF (1:4). The terminal amino group of the peptides was acetylated with $\mathrm{Ac}_{2} \mathrm{O} / \mathrm{DIEA} / \mathrm{DMF}$ (1:1:18). Cleavage from the resin was carried out using TFA/ $\mathrm{H}_{2} \mathrm{O} / \mathrm{TIS}$ (90:5:5, v/v/v) (for $\mathbf{P 1}$ and P2) or TFA/ $\mathrm{H}_{2} \mathrm{O} / E D T / T I S ~(94 / 2.5 / 2.5 / 1, \mathrm{v} / \mathrm{v} / \mathrm{v} / \mathrm{v}$ ) (for $\mathbf{P 3}$ precursor peptide ( $\mathbf{P} 4)$ ). The hydroxylamine group of the crude peptide $\mathbf{P 1}$ was oxidized to nitroxide with $\mathrm{Cu}(\mathrm{OAc})_{2}$ before RP-HPLC purification. The regeneration of the nitroxide was proven by mass spectrometry. MTSSL labeling of cysteine residues was performed with peptide $\mathbf{P 4}(1.0 \mathrm{mM})$ in a phosphate buffer/acetonitrile ( $4 / 1, \mathrm{v} / \mathrm{v}$ ) solution and MTSSL ( 5 eq. per cysteine residue). The solution was stirred under argon atmosphere at $25{ }^{\circ} \mathrm{C}$ for 12 h . The target peptide P3 was obtained by RP-HPLC.

## S4. Characterization of the molecular structure of the spin label TOPP by DFT calculations

The hybrid functionals B3LYP and PBE0 were used for calculations of the molecular geometry of the model compounds $\mathbf{1 2}$ and $\mathbf{1 3}$ (Figure S1). The geometry optimizations and frequency calculations were performed using the basis set 6-311G ( $\mathrm{d}, \mathrm{p}$ ) in the gas phase or in the dipole field of water. Therefore, the program package GAUSSIAN 09 was used. ${ }^{[2]}$

Figure S2: Geometry optimizations and frequency calculations of the conformations $B \alpha(\mathrm{a}, \mathrm{b}, \mathrm{c})$ and $B \beta(\mathrm{~d}, \mathrm{e}, \mathrm{f})$ of the compound $\mathbf{1 2}$ were obtained with the B3LYP method and the basis set $6-311 \mathrm{G}(\mathrm{d}, \mathrm{p})$ in the gas phase at 298 K.

The conformation $B \alpha$ exists in the ground state and the conformation $B \beta$ with $\mathrm{C}_{2 \mathrm{v}}$ symmetry is energetically $1.4 \mathrm{~kJ} / \mathrm{mol}$ above the ground state (Table S1). The angle $\lambda$, enclosed by the CH bond and nitroxide bond was calculated by the following formula:

$$
\cos \lambda=\frac{\vec{a} \cdot \vec{b}}{|\vec{a}| \cdot|\vec{b}|}
$$

Here, vector $\vec{a}$ is described by the CH bond and vector $\vec{b}$ by the NO bond (Figure S1).

To determine the geometry of TOPP in an $a$-helical secondary structure in water $\left(25^{\circ} \mathrm{C}\right.$, 1 atm ), the amino acid $\mathbf{1 3}$ was used as a model compound (Figure 5). The calculations were carried out with fixed dihedral angles $\left(\varphi=-52^{\circ}, \psi=-53^{\circ}\right)$. The simulation of the solvent was carried out by the continuum model (IEFPCM). Three conformational isomers of the compound $\mathbf{1 3}$ with the corresponding energy differences and the angles $\lambda$ are shown in the Table S2.
