## 'First Generation' Syntheses of the Building Blocks

Scheme S1. Reagents and conditions: a) MeI, $\mathrm{Ag}_{2} \mathrm{O}, \mathrm{MeCN}, 92 \%$; b) (i) DIBAl-H, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, $-78^{\circ} \mathrm{C}$; (ii) $\mathrm{MeCOC}\left(=\mathrm{N}_{2}\right) \mathrm{P}(\mathrm{O})(\mathrm{OMe})_{2}, \mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}, 70 \%$ (over both steps); c) TBSCl, $\mathrm{Et}_{3} \mathrm{~N}$, DMAP cat., $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 90 \%$; d) $n$-BuLi, MeI, THF, $98 \%$; e) $\mathrm{Bu}_{3} \mathrm{SnH}$, $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{PdCl}_{2}(5 \mathrm{~mol} \%)$, THF, $65 \%$; f) TBAF, THF, $93 \%$; g) (i) Dess-Martin periodinane, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 84 \%$; (ii) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CH}_{2}, n$ - BuLi , THF, $-35^{\circ} \mathrm{C} \rightarrow$ RT, $87 \%$.

The original route to the northern hemisphere of 2 employed commercial lactone 31 (ee $=96 \%$ ) as the starting material, which was O-methylated and reduced with DIBAl-H to the corresponding hemiacetal that allowed for the installation of an alkyne unit by reaction with the Ohira-Bestmann reagent (Scheme S1). ${ }^{1}$ O-Silylation of S-2 and end-capping of the alkyne in S-3 with a methyl group set the stage for a palladium-catalyzed hydrostannation which converted S-4 into product S-5 in $65 \%$ yield. ${ }^{2}$ The elaboration of this compound into the required building block 36 was readily achieved by cleavage of the silyl ether, oxidation of the resulting primary alcohol with Dess-Martin periodinane, ${ }^{3}$ and Wittig olefination of the resulting aldehyde.

${ }^{2}$ Small amounts ( $10-15 \%$ ) of the regioisomeric alkenyl-stannane could be separated by flash chromatography. Moreover, the corresponding pinacolborane has also been prepared; however, this compound failed to undergo productive cross coupling with alkenyl iodide 43.

Access was gained by DIBAl-H reduction of the known Roche ester derivative $37^{4}$ and chain extension of the resulting aldehyde with the functionalized phosphonate $\mathbf{S - 7}{ }^{5}$ furnishing enol silane S-8 as a single isomer (Scheme S2). This compound was then converted into the corresponding enol triflate 39 of opposite double bond configuration by acid catalyzed hydrolysis followed by treatment of S-9 with Comins reagent ${ }^{6}$ in the presence of KHMDS as the optimal base. Triflate 39 could be cross coupled with MeZnCl in the presence of catalytic amounts of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4} .{ }^{7}$ The elaboration of the resulting product 40 into the required building block 43 followed the route described in the Text of the paper.

Although the degradation pathway of $\mathbf{5 1}$ has not been rigorously investigated, model studies were undertaken that explain, at least in part, this unexpected behavior (Scheme S-3). Thus, treatment of the compound $\mathbf{S - 1 0}$ ( $\mathrm{R}=$ Ac, tiglinic acid) with TBSOTf$/ 2,6-l u t i d i n e ~ c o n v e r t e d ~ t h e s e ~$ compounds into a common product $\mathbf{S - 1 3}$ which was obtained in high yield as a mixture of diastereomers. It is believed that the conjugated diene efficiently communicates activation of the Boc-moiety by the Lewis acid to the seemingly remote substituent residing at C .23 (iejimalide numbering). Rearrangement of the $\pi$-system with extrusion of the ester then engenders formation of the heterocyclic motif.
In striking contrast to the acetate case, however, the corresponding pivalate $\mathbf{S - 1 0}(\mathrm{R}=\mathrm{Piv})$ allowed for the clean removal of the Boc-substituent; the bulky ester most likely forces this substrate to adopt a conformation in which orbital overlap between the $\mathrm{C}-\mathrm{O} \sigma$-bond and the $\pi$ system of the diene is minimized, thus effectively blocking the decomposition pathway. The resulting amine $\mathrm{S}-\mathbf{1 4}$ was coupled to the L-serine derivative $57^{8}$ under standard conditions to give product S-15 in excellent overall yield. The striking difference in the behavior of acetate and pivalate clearly features our still limited capacity to properly assess the degree of the homology between recorded and projected cases.

[^0]Caspase Assay. The activities of caspases 3 and 7 were quantified by the use of a commercial reagent kit (Caspase-Glo 3/7 by Promega) in a coupled enzymatic reaction, which has been used for assaying caspase activity and apoptosis in a large variety of applications. ${ }^{9}$ In this assay the luciferin-coupled tetrapeptide DEVD is used as a luminogenic substrate for caspase 3/7. The substrate is added to the cells and following caspase cleavage, a new substrate for luciferase (amino-luciferin) is released, resulting in the luciferase reaction and the production of light. The luminescent signal, produced in the luciferase reaction is proportional to the caspase activity. The assay was performed according to the protocol provided by the supplier. Thus, $5 \times 10^{3} \mathrm{NIH} 3 \mathrm{~T} 3$ cells were seeded in each well of a white-walled 96 -well luminometer plate (Corning Life Sciences) and cultured in $100 \mu \mathrm{~L}$ Dulbecco's Modified Eagle Medium (Invitrogen) supplemented with $10 \%$ fetal calf serum (DMEM/FCS) at $37^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$ in a humidified incubator. On the next day, cells were washed with PBS and fresh DMEM/FCS was added. The compounds were dissolved as 5 mM stock solution in DMSO. For each final concentration a 10x concentrated adding solution (AS) was prepared by diluting the stock solution in DMEM/FCS, e.g. for the final concentration $10 \mu \mathrm{M}, 2 \mu \mathrm{~L}$ of the stock solution were added to $98 \mu \mathrm{~L}$ DMEM/FCS to prepare the $100 \mu \mathrm{M}$ AS. Five percent DMSO in DMEM/FCS served as negative control AS. Ten microliters of each AS and of the negative control AS were added to the wells and the cells were incubated for another 24 h . Cells were washed with PBS and $100 \mu \mathrm{~L}$ of the lysis/test reagent was added to each well. The plate was covered with a plate sealer and incubated for 40 min at room temperature on a plate shaker. The luminescence was measured in a multi-well plate reader (CentroXS LB960, Berthold Technologies). The luminescence of the negative control was set as $100 \%$ and all other values were referred to this value. All concentrations were tested in triplicates.
Actin Assay. Murine NIH/3T3 fibroblasts (CRL-1658 from ATCC) were cultured at $37^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$ in Dulbecco's modified Eagle's medium supplemented with 4 mM L-glutamine, $4.5 \mathrm{~g} / \mathrm{L}$ glucose and $10 \%$ bovine calf serum. $2 \times 10^{4}$ cells were seeded on coverslips in one well of a 24 well plate. After adapting and attaching over night, the cells were incubated with $1 \mu \mathrm{M}, 5 \mu \mathrm{M}$ or $10 \mu \mathrm{M}$ of the corresponding iejimalide derivative for 18 h . Before and after each fixation or staining step the cells were washed three times with TPBS ( $0.2 \%$ Tween 20 in phosphate-buffered saline). Cells were fixed with $3.7 \%$ formalin in PBS. For blocking unspecific epitopes, fixed cells were incubated with $1 \%$ powdered milk in PBS. Actin filaments were stained for 1 h with a solution of 77 nM TRITC labelled phalloidin (P1951, Sigma) in TPBS. Cell nuclei were stained with DAPI (2-(4-amidinophenyl)-6-indolecarbamidine dihydrochloride, D9542, Sigma). Cells were visualized and photographed with a Zeiss Axiophot fluorescence microscope.

## Building Blocks: Preparation of Boronate 19

Compound 10. Bis(trimethylsilyl)acetylene ( $25.3 \mathrm{~mL}, 0.111 \mathrm{~mol}$ ) was added to a solution of acid
 chloride 9 ( $12.3 \mathrm{~mL}, 0.111 \mathrm{~mol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(140 \mathrm{~mL})$. The mixture was cooled to $0^{\circ} \mathrm{C}$ before $\mathrm{AlCl}_{3}(14.9 \mathrm{~g}, 0.111 \mathrm{~mol})$ was added in small portions over 5 min . The reaction mixture was then stirred at $0^{\circ} \mathrm{C}$ for 10 min and at $20^{\circ} \mathrm{C}$ for 1 h . For work-up, the mixture was poured onto aq. $\mathrm{HCl}(1 \mathrm{M})$ at $0^{\circ} \mathrm{C}$, the aqueous phase was extracted with diethyl ether, the combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated (because of volatility of the product, the heating bath of the rotary evaporator was set to $20^{\circ} \mathrm{C}$ and the applied vacuum was kept at $\geq 30 \mathrm{mbar}$ ). The residue was purified by Kugelrohr distillation to yield $\mathbf{1 0}$ as a colorless oil ( $16.64 \mathrm{~g}, 83 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=5.81$ (tdd, $J=16.8,10.2,6.4 \mathrm{~Hz}$, $1 \mathrm{H}), 5.04(\mathrm{~m}, 2 \mathrm{H}), 2.66(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.42(\mathrm{~m}, 2 \mathrm{H}), 0.25(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=186.9,136.3,115.7,101.9,98.0,44.3,27.8,0.8$; IR (film): $\widetilde{v}=3081,2963,2902$, 2152, 1680, 1643, 1439, 1409, 1356, 1253, 1227, 1115, 1094, 1031, 998, 968, 915, 865, 847, $762,704,626,589 \mathrm{~cm}^{-1}$; HRMS (EI/FE): m/z: calcd for $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{OSi}$ : 180.097041 [ $\left.M^{+}\right]$; found: 180.097232; elemental analysis calcd (\%) for $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{OSi}$ C $66.61, \mathrm{H} 8.94$; found: $\mathrm{C} 66.46, \mathrm{H}$ 8.98 .

Compound 12. A flame-dried Schlenk flask was charged with ketone $\mathbf{1 0}$ ( $8.37 \mathrm{~g}, 0.0446 \mathrm{~mol}$ ) and degassed isopropanol ( 350 mL ). The resulting solution was purged
 with Ar for 1.5 h before the ruthenium complex $\mathbf{1 1}$ was added as a solid $(0.175 \mathrm{~g}, 0.0292 \mathrm{~mol})$. The resulting mixture was again purged with Ar before it was stirred for 19 h at $20^{\circ} \mathrm{C}$. For work up, the mixture was transferred into a round-bottomed flask (with diethyl ether), the solvents were evaporated under reduced pressure (due to volatility of the product, the heating bath of the rotary evaporator was set to $20^{\circ} \mathrm{C}$ and the applied vacuum was kept at $\geq 30 \mathrm{mbar}$ ), and the crude product was purified by flash chromatography (hexanes/ethylacetate, $50: 1 \rightarrow 30: 1$ ) to give alcohol 12 as a colorless oil ( $8.31 \mathrm{~g}, 98 \%$ ). $[\alpha]_{D}^{20}=+6\left(c=0.43, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) ;{ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=5.84(\mathrm{tdd}, J=6.7,10.2,16.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.03(\mathrm{~m}, 2 \mathrm{H}), 4.38(\mathrm{t}, J=6.5 \mathrm{~Hz}, 1 \mathrm{H})$, $2.23(\mathrm{~m}, 2 \mathrm{H}), 1.77-1.83(\mathrm{~m}, 2 \mathrm{H}), 0.18(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=137.7,115.3$, 106.5, 89.7, 62.4, 36.8, 29.4, -0.1; IR (film): $\widetilde{v}=3336,3079,2959,2900,2863,2173,1642$, $1440,1415,1332,1251,1121,1068,1046,1016,955,913,895,844,761,700,648,612,555$, $489 \mathrm{~cm}^{-1}$; MS (EI): m/z: 167 (9), 149 (8), 140 (17), 127 (15), 125 (12), 99 (45), 92 (10), 91 (32), 75 (100), 73 (73), 61 (12), 45 (21), 43 (13), 41 (13); elemental analysis calcd (\%) for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{OSi}$ : C 65.87, H 9.95; found: C 65.72, H 9.84.

Compound 13. $n-B u L i(10.6 \mathrm{~mL}, 1.6 \mathrm{M}$ in hexanes) was added dropwise over a period of 10 min
 via a syringe pump to a solution of compound $12(3.10 \mathrm{~g}, 0.017 \mathrm{~mol})$ in THF ( 60 mL ) at $-78^{\circ} \mathrm{C}$. Once the addition was complete, stirring was continued for 10 min at $-78^{\circ} \mathrm{C}$ before $\mathrm{MeI}(8.5 \mathrm{~mL}, 0.137 \mathrm{~mol})$ was added dropwise to the mixture. The temperature was then raised to
$-25^{\circ} \mathrm{C}$, at which point DMSO ( 2.5 mL ) was slowly introduced, causing the formation of a white precipitate. After stirring for 1 h at that temperature, the cooling bath was removed and stirring continued at $20^{\circ} \mathrm{C}$ for 21 h . The reaction mixture was poured to a $1: 1$ mixture of ice and aq. sat. $\mathrm{NH}_{4} \mathrm{Cl}$, the organic phase was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the organic layers were combined, washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated (due to high volatility of the product, the heating bath of the rotary evaporator bath was set to $20^{\circ} \mathrm{C}$ and pressure kept at $\geq 35 \mathrm{mbar}$ ) to give product 13 as pale yellow oil ( $3.30 \mathrm{~g}, 99 \%$, ee $=98.8 \%$ ). The resulting heterogeneous mixture was stirred for 3 h before it was diluted with water, the aqueous phase was extracted with tert-butyl methyl ether and EtOAc, the combined organic layers were washed with $\mathrm{HCl}(1 \mathrm{~m})$ and brine, dried over $\mathrm{MgSO}_{4}$, and carefully evaporated (due to high volatility of the product, the heating bath of the rotary evaporator bath was set to $20^{\circ} \mathrm{C}$ and pressure kept at $\geq 35 \mathrm{mbar}$ ) The crude product was purified by flash chromatography (pentanes $/ \mathrm{Et}_{2} \mathrm{O}, 15: 1$ ) to give product 14 as a colorless oil ( $995 \mathrm{mg}, 76 \%$ ). $[\alpha]_{D}^{20}=-82.1\left(c=0.51, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) ;{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=9.79(\mathrm{t}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.01$ $(\mathrm{t}, J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.38(\mathrm{~s}, 3 \mathrm{H}), 2.61(\mathrm{~m}, 2 \mathrm{H}), 2.04(\mathrm{dt}, J=7.2,6.2 \mathrm{~Hz}, 2 \mathrm{H}), 0.18(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=201.8,103.5,91.7,70.5,56.6,39.7,28.2,0.1$; $\operatorname{IR}$ (film): $\widetilde{v}=2960$, 2941, 2900, 2824, 2724, 2170, 1727, 1466, 1440, 1412, 1390, 1334, 1251, 1201, 1178, 1114, 1091, 1017, 989, 958, 919, 844, 761, 700, 668, $612 \mathrm{~cm}^{-1}$; HRMS (CI/FE $i$-butane): m/z: calcd for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{O}_{2} \mathrm{Si}+\mathrm{H}$ : $199.115434\left[M^{+}+\mathrm{H}\right]$; found: 199.115280; elemental analysis calcd (\%) for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{O}_{2} \mathrm{Si}: \mathrm{C} 60.56$, H 9.15; found: C 60.43, H 9.08.

After filtration through a pad of Celite and evaporation of the filtrate, aldehyde 34 was obtained in sufficient quality for immediate use in the subsequent allylation ( $730 \mathrm{mg}, 95 \%$ crude yield). The recorded spectroscopic data were identical to those reported in literature. ${ }^{13}$

## Total Synthesis of Iejimalide B - 'Teoc-Strategy’

Compound 58. TFA ( $10 \mathrm{~mL}, 130 \mathrm{mmol}$ ) ) was added dropwise to a solution of compound 23
 ( $799 \mathrm{mg}, 2.97 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(35 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was stirred at ambient temperature for 1 h before it was evaporated and the crude amine thus formed was dried under high vacuum for 1 h .
$\mathrm{Et}_{3} \mathrm{~N}(2.8 \mathrm{~mL}, 20 \mathrm{mmol})$ and 4-nitrophenyl-2-trimethylsilylethyl-carbonate ( $1.7 \mathrm{~g}, 6 \mathrm{mmol}$ ) were added to a solution of the crude amine in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(35 \mathrm{~mL})$. The resulting yellow solution was stirred for 24 h before it was extracted with aq. sat. $\mathrm{Na}_{2} \mathrm{CO}_{3}$ to remove the released nitrophenol. The mixture was washed with brine, the organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated, and the crude product purified by flash chromatography (hexanes/EtOAc, 4:1) to give product 58 as a pale yellow oil ( $887 \mathrm{mg}, 96 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta=7.43(\mathrm{~d}, J=11.8 \mathrm{~Hz}, 1 \mathrm{H})$, $6.24(\mathrm{~d}, J=11.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.98(\mathrm{bs}, 1 \mathrm{H}), 4.16(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 3.82(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.72$ $(\mathrm{s}, 3 \mathrm{H}), 1.92(\mathrm{~s}, 3 \mathrm{H}), 1.86(\mathrm{~s}, 3 \mathrm{H}), 0.98(\mathrm{t}, \mathrm{J}=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 0.05(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ): $\delta=169.2,157.1,144.0,133.6,126.8,120.3,63.5,52.0,48.5,18.0,15.6,13.0,-1.5$; IR (film): $\widetilde{v}=3348,2952,1695,1523,1434,1244,1110,1059,941,834,751 \mathrm{~cm}^{-1} ;$ HRMS (ESI): $\mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{15} \mathrm{H}_{27} \mathrm{NO}_{4} \mathrm{Si}+\mathrm{Na}: 336.160159$ [ $M^{+}+\mathrm{Na}$ ]; found: 336.160418 ; elemental analysis calcd (\%) for $\mathrm{C}_{15} \mathrm{H}_{27} \mathrm{NO}_{4} \mathrm{Si}$ : C 57.47, H 8.68; found: C 57.40, H 8.72.

Compound 68. A solution of TBAF ( $17 \mu \mathrm{~L}, 1 \mathrm{M}$ in THF) was added dropwise to a solution of compound $66(3.0 \mathrm{mg}, 0.0042 \mathrm{mmol})$ in THF $(0.1 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was allowed to reach ambient temperature and was stirred for 36 h before it was diluted with EtOAc and extracted with aq. sat. $\mathrm{NH}_{4} \mathrm{Cl}$. The combined organic phases were dried over $\mathrm{MgSO}_{4}$ and evaporated to give amine 67 which was immediately used in the next step without further purification.

N-Formyl-L-valine ( $0.8 \mathrm{mg}, 0.0054$
 mmol), HOAt ( $0.70 \mathrm{mg}, 0.0050$ $\mathrm{mmol})$, and collidine ( $1.7 \mu \mathrm{~L}, 0.013$ mmol ) were added to a solution of crude 67 in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.1 \mathrm{~mL})$ and the solution was cooled to $0^{\circ} \mathrm{C}$ before EDC $\mathrm{HCl}(1.2 \mathrm{mg}, 0.0063 \mathrm{mmol})$ was introduced. The mixture was stirred at ambient temperature for 20 h .  compound 84 ( $15 \mathrm{mg}, 0.0195$ $\mathrm{mmol})$ and $\mathrm{LiCl}(1.7 \mathrm{mg}, 0.04$ $\mathrm{mmol})$ in $\mathrm{MeCN}(0.7 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$.
