General: All reactions were carried out under Ar in flame-dried glassware. The solvents used were purified by distillation over the drying agents indicated and were transferred under Ar: THF, $\mathrm{Et}_{2} \mathrm{O}$ (Mg-anthracene), $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(\mathrm{P}_{4} \mathrm{O}_{10}\right)$, $\mathrm{MeCN}, \mathrm{Et}_{3} \mathrm{~N}\left(\mathrm{CaH}_{2}\right), \mathrm{MeOH}(\mathrm{Mg})$, DMF, DMA (Desmodur ${ }^{8}$, dibutyltin dilaurate), hexane, toluene ( $\mathrm{Na} / \mathrm{K}$ ). Flash chromatography: Merck silica gel 60 (230-400 mesh). NMR: Spectra were recorded on a Bruker DPX 300, AV 400 , or DMX 600 spectrometer in the solvents indicated; chemical shifts ( $\delta$ ) are given in ppm relative to TMS, coupling constants $(J)$ in Hz . The solvent signals were used as references and the chemical shifts converted to the TMS scale $\left(\mathrm{CDCl}_{3}: \delta_{\mathrm{C}} \equiv 77.0 \mathrm{ppm}\right.$; residual $\mathrm{CHCl}_{3}$ in $\mathrm{CDCl}_{3}: \delta_{\mathrm{H}} \equiv 7.24 \mathrm{ppm} ; \mathrm{CD}_{2} \mathrm{Cl}_{2}: \delta_{\mathrm{C}} \equiv 53.8 \mathrm{ppm}$; residual $\mathrm{CH}_{2} \mathrm{Cl}_{2} \mathrm{in}^{\mathrm{CD}} \mathrm{Cl}_{2}: \delta_{\mathrm{H}} \equiv 5.32 \mathrm{ppm}$ ). IR: Nicolet FT-7199 spectrometer, wavenumbers ( $\widetilde{v}$ ) in $\mathrm{cm}^{-1}$. MS (EI): Finnigan MAT 8200 (70 eV), ESI-MS: Finnigan MAT 95, accurate mass determinations: Bruker APEX III FT-MS ( 7 T magnet). Melting points: Gallenkamp melting point apparatus (uncorrected). Elemental analyses: H. Kolbe, Mülheim/Ruhr. All commercially available compounds (Fluka, Lancaster, Aldrich) were used as received.

## Starting Materials

Method A: General Procedure for the $\mathbf{P t C l}_{2}$-Catalyzed Allylation of Alkynals. A suspension of $\mathrm{PtCl}_{2}$ (5\%), the alkynal (1 eqiv.), and allylchlorodimethylsilane 4 (1.2 eq.) in $\mathrm{MeCN}(5 \mathrm{~mL} / \mathrm{mmol})$ was stirred for $15-20 \mathrm{~h}$ at ambient temperature. Saturated aq. $\mathrm{NaHCO}_{3}$ was added, the aqueous phase was repeatedly extracted with methyl tert-butyl ether, the combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated. The residue was dissolved in THF ( $25 \mathrm{~mL} / \mathrm{mmol}$ ) and treated with $\mathrm{Bu}_{4} \mathrm{NF} \cdot 3 \mathrm{H}_{2} \mathrm{O}(300 \mathrm{mg} / \mathrm{mmol})$ for 30 min . Evaporation of the solvent and subsequent flash chromatography of the crude product
(hexanes/EtOAc mixture) afforded the corresponding homoallyl alcohols in analytically pure form.

Method B: General procedure for Allylation of Alkynals via Grignard Reaction. A solution of the alkynal ( 1 eq .) in THF was added to a solution of allylmagnesium bromide ( 1 M in $\mathrm{Et}_{2} \mathrm{O}, 1.5$ eq.) at $0^{\circ} \mathrm{C}$ and stirring was continued for 1 h . The reaction was carefully quenched with water at $0^{\circ} \mathrm{C}$ and the aqueous layer was extracted with methyl tert-butyl ether. The combined organic phases were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ before they were filtered and evaporated. Purification of the residue by flash chromatography (hexanes/EtOAc mixture) afforded the corresponding homoallylic alcohol in analytically pure form.

General Procedure for the $\mathbf{P t C l}_{\mathbf{2}}$-Catalyzed Cycloisomerization Reaction. $\mathrm{PtCl}_{2}$ (5\%) was added to a solution of the enyne in toluene ( $5 \mathrm{~mL} / \mathrm{mmol}$ ) and the resulting mixture was stirred at $60-80^{\circ} \mathrm{C}$ until the reaction was complete (GC/MS and TLC). The solvent was evaporated and the residue was purified by flash chromatography (hexanes/EtOAc mixture) to give the bicyclo[3.1.0]hexanone derivative in analytically pure form. The physical data of the compounds thus formed are compiled below.
'One-Pot' Allylation/Cycloisomerization Cascade. $\mathrm{PtCl}_{2}$ ( $13.3 \mathrm{mg}, 15 \%$ ) was added to a solution of aldehyde $1(65 \mathrm{mg}, 0.5 \mathrm{mmol})$ in $\mathrm{MeCN}(2.5 \mathrm{~mL})$ followed by allylchlorodimethylsilane $4(151 \mathrm{mg}, 0.6 \mathrm{mmol})$ and the resulting mixture was stirred at $80^{\circ} \mathrm{C}$ for 24 h . After cooling to room temperature, TBAF $3 \mathrm{H}_{2} \mathrm{O}(160 \mathrm{mg})$ was introduced and the mixture was stirred for 30 min at room temperature. Saturated aq. $\mathrm{NaHCO}_{3}$ was then added, the aqueous phase was repeatedly extracted with methyl tert-butyl ether, the combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated, and the residue was purified by flash chromatography (hexanes/EtOAc mixture) to give product 3a in analytically pure form ( $47 \mathrm{mg}, 55 \%$ ).
