## Supplementary Figure Legends

Sup. Fig. 1. Determination of the $\mathrm{IC}_{50}$ values of $\mathrm{A} \beta 42$ inhibition of fibrillization for compounds 5, 6, 7 and 10. The $\mathrm{IC}_{50}$ values were determined from the percent inhibition of aggregation values obtained at the end of the experiment. Thereafter these values were plotted against $\log$ of the inhibitor concentration. Fitting the data with a sigmoidal function in the Prism software (GraphPad Software, USA) the $\mathrm{IC}_{50}$ was obtained at the halfway of the percent inhibition of aggregation.

Sup. Fig. 2. Ligand-dependent conversion of $A \beta 42$ into oligomers. (A) Intensity changes of proton signals in $1 \mathrm{D}{ }^{1} \mathrm{H}$ NMR spectra of $\mathrm{A} \beta 42$ upon addition of compound 7 at various ratios. Changes in the methyl and backbone amide signals are shown separately. Reference values were obtained following addition of DMSO (without compound 7) at corresponding volumes. Note that backbone amide signals decay more strongly than the side chain methyl signals. (B) Intensity changes of proton signals in $1 \mathrm{D}{ }^{1} \mathrm{H}$ NMR spectra of $A \beta 42$ upon addition of compound 10 at various ratios. Changes in the methyl and backbone amide signals are shown separately. Reference values were obtained following addition of DMSO (without compound 10) at corresponding volumes.

Sup. Fig. 3. Residue-specific intensity changes of correlation peaks in 2D HSQC spectra of ${ }^{15} \mathrm{~N}$-labelled A $\beta 42$ upon addition of compound $6(A)$, compound $7(B)$ and compound $10(C)$ at the specified ratios. The reference values were obtained following addition of DMSO (without compounds) at the volume corresponding to the highest ligand/ A $\beta 42$ ratio.

Sup. Fig. 4. Binding of compound 6 to monomeric A $\beta 42$. Average backbone amide proton and nitrogen chemical shift deviations obtained from 2D $\left[{ }^{1} \mathrm{H},{ }^{15} \mathrm{~N}\right]$-HSQC spectra of ${ }^{15} \mathrm{~N}$-labelled A $\beta 42$ at increasing compound $6 /$ peptide ratios. The dotted line corresponds to the average uncertainty in the chemical shifts. Note that chemical shift deviations change roughly linearly with compound concentration, i.e. the binding is weak and far from saturation.

A $\beta 42$ protofibrils eluted after an elution volume of $6-8 \mathrm{ml}$ (fractions F6 to F8). The second peak contained low molecular weight Aß42.

## Supplementary Methods

## Small molecule synthesis

The symmetrical compounds bearing an ethylenediamine linker unit were prepared from 4-, or 5-aryl substituted 3-aminopyrazoles. The 4- or 5-aryl substituted amino pyrazoles were treated with one equivalent of tert-butyl dicarbonate to afford the corresponding $N^{1}$-Boc-protected aminopyrazole building blocks (Fig. S5) as the basic ring NH group is more reactive than the aromatic amino group (1). The reaction of the $N^{1}$-Boc-protected aminopyrazole derivatives with oxalylchloride in acetonitrile without any base afforded the symmetrical final compound (1) containing an oxalyl linker. In most of the cases Boc deprotection also occurred during the reaction. Compounds where partial deprotection occurred were directly used in next reduction step. While doing the reaction in presence of triethyl amine base no deprotection of Boc group observed.
Reduction of the oxalyl moiety of the Boc-protected or unprotected symmetrical derivatives was achieved by treating the compounds with borane dimethylsulfide complex in tetrahydrofurane (2). After refluxing the reaction mixture for overnight, it was treated with concentrated HCl and refluxed for another 16 hours to decompose the borane complex. The free base was isolated upon adjusting the pH to 14 followed by extraction and subsequent purification on silica gel chromatography. Treating the free base with methanolic HCl afforded the symmetrical compounds ( $\mathbf{2}, \mathbf{3}, \mathbf{4}, \mathbf{5}, \mathbf{6}, \mathbf{7}, \mathbf{8}$ ) bearing an ethylenediamine linker as HCl -salts (Fig. S5). For the preparation of compound 7, building block 20 was prepared (Fig. S9). Special reaction conditions were applied for the synthesis of compound $\mathbf{9}$, as the furan moiety is sensitive to strong acids. The mild lewis acid $\mathrm{BF}_{3} \mathrm{XOEt}$ 2 was used for in situ cleavage of the boran dimethyl sulfide complex during the reduction step and compound $\mathbf{9}$ was isolated as the free base.
To synthesize non-symmetrical compounds $\mathbf{1 0}$ and $\mathbf{1 3}$ having different aryl substituents at the 5-position of 3 -aminopyrazoles, another set of building blocks 41, 42, and $\mathbf{4 3}$ containing a THP-protecting group at the $\mathrm{N}^{1}$-position of 3 -aminopyrazole was prepared (Fig. S6). Reaction of 5 -aryl substituted 3aminopyrazoles with acetyl chloride afforded compounds being acylated at the $N^{1}$-position and at the 3 amino-group. A selective de-acylation of the $N^{1}$-position was achieved by treatment with aqueous ammonia solution at room temperature. Then the $N^{1}$-position was protected with the tetrahydropyrane (THP) moiety in the presence of trifluoroacetic acid. The cleavage of the acetyl group was achieved by refluxing the starting material under basic conditions (potassium hydroxide), to afford the 3 -amino- $N^{1}$ THP protected building blocks 41,42 , and $\mathbf{4 3}$ as two regioisomers each. The 3 -amino- $N^{1}$-THP protected building block $\mathbf{4 2}$ was treated with mono ethyl oxalyl chloride to afford the corresponding ester derivative (44). The mono ester reaction product was treated with lithium hydroxide to afford the corresponding free acid derivative 45. The coupling reaction of the free acid derivative 45 with 3 -amino- $N^{1}$-THP protected building blocks $\mathbf{4 1}$ and $\mathbf{4 3}$ was achieved via activation of the acid with Deoxo-Fluor (3) to afford the corresponding unsymmetrical 5 -aryl substituted $N^{1}$-THP protected derivatives 46, and 47. The oxalyl moiety was reduced with borane dimethyl sulfide complex to the corresponding non-symmetrical 5 -aryl substituted compounds ( $\mathbf{1 0}$ and $\mathbf{1 3}$ ) containing an ethylenediamine linker.
Another set of non-symmetrical compounds (Fig. S7) were prepared by reacting $N^{1}$-THP protected 5 -aryl 3-aminopyrazole building blocks ( $\mathbf{4 2}$ and $\mathbf{4 3}$ ) with bromo acetyl bromide to afford the corresponding amide coupling derivatives 48 and 49 . The nucleophilic displacement of the bromide by different $N^{1}$-THP protected 5-aryl 3-aminopyrazole building blocks ( $\mathbf{4 2}$ and $\mathbf{4 3}$ ) under basic reaction conditions afforded to the corresponding the reaction products $\mathbf{5 0}$ and $\mathbf{5 1}$. Cleavage of the THP-protecting groups was achieved by treatment with trifluoroacetic acid to afford the corresponding non-symmetric 5 -aryl-substituted 3aminopyrazole compounds ( $\mathbf{1 1}$ and $\mathbf{1 2}$ ) containing a linker with one amide bond.
Compound 14 containing a 5 -tolyl-substituted 3 -aminopyrazole linked via a C 1 -linker to a 5 -tolyl pyrazole moiety (Fig. S8) was also prepared. Commercially available 5-tolyl-pyrazole-3-carboxylic acid was converted to its corresponding methyl ester 52. THP-protection at the $N^{1}$-position of pyrazole, followed by the cleavage of the methyl ester $\mathbf{5 3}$ under basic conditions afforded the $N^{1}$-THP protected 5-tolyl-3-carboxylic acid pyrazole derivative 54. Coupling of the pyrazole-3-carboxylic acid derivative $\mathbf{5 4}$
to the $N^{1}$-THP protected 5-tolyl 3-aminopyrazole building block 42 mediated by Mukaiyama's reagent (4) afforded the corresponding coupling product 55 . Reduction of the amide bond was achieved with borane dimethylsulfide complex to afford compound 14.

## Supplementary Results

General methods. All reagents and solvents were obtained from commercial sources and used without further purification. Proton $\left({ }^{1} \mathrm{H}\right)$ and carbon $\left({ }^{13} \mathrm{C}\right)$ NMR spectra were recorded on a Bruker DPX 400 MHz NMR spectrometer in deuterated solvents. Mass spectra (MS) were recorded on a Finnigan MAT TSQ 7000 spectrometer. Chromatography was performed using silica gel (Fluka: Silica gel 60, 0.063-0.2 mm) and suitable solvents as indicated in specific examples. Thin layer chromatography (TLC) was carried out on silica gel plates with UV detection.

General procedure for the preparation of compound 1 having an oxalyl linker and substituents at the 4position of 3-aminopyrazole ( $N, N$ '-bis(4-(4-chlorophenyl)-1H-pyrazol-3-yl)oxalamide) (1)
To a solution of compound $15(0.5 \mathrm{~g}, 1.70 \mathrm{mmol})$ in anhydrous acetonitrile $(20 \mathrm{ml})$ was added a solution of oxalyl chloride ( 2 M in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.42 \mathrm{ml}, 0.84 \mathrm{mmol}$ ). The resulting mixture was stirred under reflux for 30 min . The precipitate was filtrated and washed with acetonitrile and dichloromethane to obtain the product as a light yellow solid $(0.186 \mathrm{~g}, 49 \%) ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right): \delta 7.39(\mathrm{~d}, J=8.3 \mathrm{~Hz}$, $4 \mathrm{H}), 7.47(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 4 \mathrm{H}), 8.10(\mathrm{~s}, 2 \mathrm{H}), 10.63(\mathrm{~s}, 2 \mathrm{H})$.

Procedure for the preparation of compound 2 having a flexible ( $-\mathrm{CH}_{2}-\mathrm{CH}_{2}-$ ) linker and substituents at the 4-position of 3-aminopyrazole
(N,N’-bis(4-(4-chlorophenyl)-1H-pyrazol-3-yl)ethane-1,2-diamine dihydrogen-chloride) (2)
A solution of compound $1(0.185 \mathrm{~g}, 0.42 \mathrm{mmol})$ in anhydrous DMF ( 6 ml ) was refluxed with 3,4dihydropyran ( $0.27 \mathrm{ml}, 2.93 \mathrm{mmol}$ ) and trifluoroacetic acid ( $2 \mathrm{uL}, 0.02 \mathrm{mmol}$ ) under inert atmosphere for 48 hrs . The solvent was evaporated and the excess of 3,4-dihydropyran was removed by chromatography on silica gel column (eluent: PE : EtOAc, 80:20). To a solution of THP-protected $N$, $N^{\prime}$-bis(4-(4-chlorophenyl)-1H-pyrazol-3-yl)oxalamide in anhydrous THF ( 15 ml ) was added drop wise borane dimethyl sulfide complex ( $0.28 \mathrm{ml}, 2.94 \mathrm{mmol}$ ) and the reaction mixture was stirred under reflux for 16 h . The reaction was cooled down to $0{ }^{\circ} \mathrm{C}$ and $\mathrm{MeOH}(1 \mathrm{ml})$ was added and the mixture was stirred for 1 h . Then conc. $\mathrm{HCl}(12 \mathrm{~N})$ was added, until a $\mathrm{pH}<2$ was obtained, and the resulting mixture was stirred under reflux for 24 h . The mixture was cooled to room temperature, solvent was evaporated and residue was neutralized with 1 M sodium hydroxide solution. The aqueous phase was extracted with $\mathrm{CHCl}_{3}$ ( 5 x 20 ml ), and after drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, the solvent was evaporated. The residue was purified by chromatography on silica gel column (eluent: EtOAc) to obtain the free base as a white solid ( $0.058 \mathrm{~g}, 33$ $\%)$. The free base ( $0.058 \mathrm{~g}, 0.14 \mathrm{mmol}$ ) was then dissolved in methanolic $\mathrm{HCl}(3 \mathrm{~N}, 2 \mathrm{ml})$ and precipitated by addition of $\mathrm{Et}_{2} \mathrm{O}$. The solid was filtered, washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried under vacuum to afford the product as white solid ( $0.061 \mathrm{~g}, 88 \%$ ). $\mathrm{Mp}=228{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right): \delta 3.46$ $(\mathrm{s}, 4 \mathrm{H}), 7.44(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 4 \mathrm{H}), 7.49(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 4 \mathrm{H}), 8.23(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right):$ $\delta 42.80,104.47,128.40,128.68,129.67,130.84,131.83,148.86$. Procedure for the preparation of compounds 3-8 having a flexible (- $\mathrm{CH}_{2}-\mathrm{CH}_{2^{-}}$) linker and substituents at the 5-position of 3-aminopyrazole
To a suspension of the oxalyl-amide derivatives 23-29 (1 eq.) in dry THF or dioxane ( 30 ml ) was added borane dimethylsulfide complex ( 6 eq .) and the reaction mixture was refluxed for 16 h . Then, the solution was cooled to $0^{\circ} \mathrm{C}$ and added methanol ( 4 ml ) and followed by concentrated $\mathrm{HCl}(4 \mathrm{ml})$. The resulting reaction mixture was further refluxed for 16 h . Then the reaction mixture was cooled to room temperature and concentrated; the residue was diluted with ( 5 ml ) water and the aqueous phase pH was adjusted to
above 12 with NaOH and extracted with $\mathrm{CHCl}_{3}(150 \mathrm{ml})$. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}$, brine solution, over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under vacuum. The free base compound was dissolved in methanolic $\mathrm{HCl}(3 \mathrm{~N}, 1 \mathrm{ml})$ and stirred for overnight. The precipitate was filtered and dried under vacuum to give corresponding hydrochloride salt.

The solvent was evaporated under vacuum and the residue dissolved in chloroform. The organic phase was washed with water, brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The organic solvent was evaporated under vacuum and the residue purified using a silica gel column ( $\mathrm{EtOAc} / \mathrm{PE}, 3: 7$ to 6:4) to afford the product ( $0.064 \mathrm{~g}, 40 \%$ ).
(2-(5-(4-chlorophenyl)-1-(tetrahydro-2H-pyran-2-yl)-1H-pyrazol-3-ylamino)-N-(1-(tetrahydro-2H-pyran-2-yl)-5-p-tolyl-1H-pyrazol-3-yl)acetamide) (51)
To a solution of compound $43(0.073 \mathrm{~g}, 0.26 \mathrm{mmol})$ in acetonitrile ( 3 ml ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(0.073 \mathrm{~g}$, $0.53 \mathrm{mmol})$ and compound $49(0.2 \mathrm{~g}, 0.53 \mathrm{mmol})$. The reaction mixture was then stirred at room temperature overnight. Then tetrabutylammoniumiodide ( $0.019 \mathrm{~g}, 0.053 \mathrm{mmol}$ ) was added and stirring was continued for another 24 h at room temperature. The solvent was evaporated under vacuum and the residue dissolved in chloroform. The organic phase was washed with water, brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The organic solvent was evaporated under vacuum and the residue purified using a silica gel column ( $\mathrm{EtOAc} / \mathrm{PE}, 3: 7$ to $6: 4$ ) to afford the product $(0.05 \mathrm{~g}, 38 \%) .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.41(\mathrm{~m}, 8 \mathrm{H})$, 5.69-5.70 (m, 2H), 4.95-5.1(m, 2H), 4.08-4.11 (m, 4H), 3.52-3.55 (m, 4H), 2.41-2.51 (m, 7H), 1.67-1.79 (m, 4H), 1.46-1.56 (m, 4H).
(Methyl 5-p-tolyl-1H-pyrazole-3-carboxylate) (52)
A mixture of commercially available 5-p-tolyl-1H-pyrazole-3-carboxylic acid ( $0.25 \mathrm{~g}, 1.24 \mathrm{mmol}$ ) and sulfuric acid $(0.120 \mathrm{ml}, 1.48 \mathrm{mmol})$ in methanol $(5 \mathrm{ml})$ was refluxed for 16 h . The solvent was evaporated under vacuum and the residue suspended in dichloromethane. The mixture was filtered, the white solid washed with dichloromethane and dried under vacuum. The filtrate was washed with water, brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was evaporated under vacuum and the white solid was combined with the precipitate from the filtration to afford the product as white solid ( $0.22 \mathrm{~g}, 84 \%$ ) . ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$,

(Methyl 1-(tetrahydro-2H-pyran-2-yl)-5-p-tolyl-1H-pyrazole-3-carboxylate) (53)
A mixture of compound $52(0.22 \mathrm{~g}, 1.03 \mathrm{mmol}), 3,4$-dihydro- $2 H$-pyran $(0.190 \mathrm{ml}, 2.07 \mathrm{mmol})$ and trifluoroacetic acid ( $0.002 \mathrm{ml}, 0.02 \mathrm{mmol}$ ) in anhydrous acetonitrile ( 3 ml ) was refluxed for 2 h . The solvent was evaporated and residue was re-dissolved in dichloromethane ( 50 ml ). The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}$, brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent evaporated under vacuum. The residue was purified using a silica gel column ( $\mathrm{PE}: \mathrm{EtOAc}, 6: 4$ ) to afford the product $(0.36 \mathrm{~g}, 68 \%) .{ }^{1} \mathrm{H}-\mathrm{NMR}$ (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.40(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.27(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 6.82(\mathrm{~s}, 1 \mathrm{H}), 5.25(\mathrm{~d}, J=10.0 \mathrm{~Hz}$, $1 \mathrm{H}), 4.11(\mathrm{~m}, 1 \mathrm{H}), 3.92(\mathrm{~s}, 3 \mathrm{H}), 3.57(\mathrm{t}, J=10.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.61(\mathrm{~m}, 1 \mathrm{H}), 2.41(\mathrm{~s}, 3 \mathrm{H}), 2.03(\mathrm{~m}, 1 \mathrm{H}), 1.82$ $(\mathrm{d}, J=8.06 \mathrm{~Hz}, 1 \mathrm{H}), 1.58-1.52(\mathrm{~m}, 3 \mathrm{H})$.

## (1-(tetrahydro-2H-pyran-2-yl)-5-p-tolyl-1H-pyrazole-3-carboxylic acid) (54)

Compound $53(0.36 \mathrm{~g}, 0.70 \mathrm{mmol})$ was dissolved in a mixture of $\mathrm{MeOH} / \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}(1: 2: 1,4 \mathrm{ml})$. After the addition of excess lithium hydroxide, the reaction mixture was stirred for 16 h . The reaction mixture was diluted with water and washed with dichloromethane. The aqueous phase was separated and evaporated under vacuum to afford the product as white solid ( 0.2 g , quantitative). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $7.13(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.04(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.60(\mathrm{~s}, 1 \mathrm{H}), 4.92(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.89(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, $1 \mathrm{H}), 3.35(\mathrm{t}, J=10.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.40(\mathrm{~m}, 1 \mathrm{H}), 2.31(\mathrm{~s}, 3 \mathrm{H}), 1.75(\mathrm{~m}, 1 \mathrm{H}), 1.54(\mathrm{~m}, 2 \mathrm{H}), 1.25(\mathrm{~m}, 2 \mathrm{H})$.
(1-(tetrahydro-2H-pyran-2-yl)-N-(1-(tetrahydro-2H-pyran-2-yl)-5-p-tolyl-1H-pyrazol-3-yl)-5-p-tolyl-1H-pyrazole-3-carboxamide) (55)
To a solution of compound $54(0.1 \mathrm{~g}, 0.34 \mathrm{mmol})$, 2-chloro-1-methylpyridinium iodide ( $0.12 \mathrm{~g}, 0.47$ $\mathrm{mmol})$ and $N, N$ '-diisopropylethylamine $(0.16 \mathrm{ml}, 0.94 \mathrm{mmol})$ in dichloromethane $(10 \mathrm{ml})$ was added 5-tolyl-1-(tetrahydro-2H-pyran-2-yl)-1H-pyrazol-3-amine $(0.08 \mathrm{~g}, 0.31 \mathrm{mmol})$. The reaction mixture was stirred at room temperature for 16 h . The reaction was diluted with water and extracted with dichloromethane. The organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent evaporated under vacuum. The residue was purified using a silica gel column ( $\mathrm{PE}: \mathrm{EtOAc}, 9: 1$ ) to afford the product ( $0.07 \mathrm{~g}, 43 \%$ ). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 9.37(\mathrm{~s}, 0.5 \mathrm{H}), 9.34(\mathrm{~s}, 0.5 \mathrm{H}), 7.43(\mathrm{~m}, 4 \mathrm{H}), 7.28(\mathrm{~m}, 4 \mathrm{H})$, $6.95(\mathrm{~s}, 0.5 \mathrm{H}), 6.94(\mathrm{~s}, 0.5 \mathrm{H}), 6.90(\mathrm{~s}, 1 \mathrm{H}), 5.24(\mathrm{~m}, 2 \mathrm{H}), 4.15(\mathrm{~m}, 2 \mathrm{H}), 3.60(\mathrm{~m}, 2 \mathrm{H}), 2.45(\mathrm{~m}, 2 \mathrm{H}), 2.42$ $(\mathrm{s}, 6 \mathrm{H}), 1.80(\mathrm{~m}, 2 \mathrm{H}), 1.56(\mathrm{~m}, 4 \mathrm{H}), 1.25(\mathrm{~m}, 4 \mathrm{H})$.
