## Experimental procedures:

General: All reactions were carried out in flame-dried glassware under Ar. All solvents were purified by distillation over the appropriate drying agents and were transferred under Ar. IR: Nicolet FT-7199 spectrometer, wavenumbers in $\mathrm{cm}^{-1}$. MS (EI): Finnigan MAT $8200(70 \mathrm{eV})$, ESIMS: Finnigan MAT 95, accurate mass determinations: Bruker APEX III FT-MS (7 T magnet). NMR Spectra were recorded on a Bruker AV 500, AV 400 or DPX $300 ;{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts ( $\delta$ ) are given in ppm relative to TMS, coupling constants $(J)$ in Hz . The solvent signals were used as references and the chemical shifts converted to the TMS scale.

All commercially available compounds (Acros, Aldrich) were used as received. The ylides $\mathbf{2 d} \mathbf{d}^{1}, \mathbf{2 f}^{2}, \mathbf{2 e}^{\mathbf{3}} 5^{4}, \mathbf{7}$ and $\mathbf{9}^{5}$ were prepared according to literature procedures. Gold (I) isonitriles $\mathbf{1 a}$ and $\mathbf{1 b}$ were prepared using the method described by Hashmi et. al. in quantitative yields ${ }^{6}$. Phenylisocyanide was prepared by the method of Weber et. al. from aniline ${ }^{7}$.

## General procedure for AAYC-gold complexes bearing phosphorus ylides:

In a typical procedure, Gold (I) isonitrile $\mathbf{1}$ is suspended in toluene $(0.024 \mathrm{M})$ followed by addition of ylide $\mathbf{2}$ at the indicated temperature. After stirring the reaction for the referred time, the mixture was allowed to reach room temperature and the solvents filtered out. The remaining white solid thus obtained was then washed with small portions of pentane and dried under vacuum.
