## Theoretical methods

### General

All calculations were performed using the Gaussian09 suite of quantum chemical programs.<sup>1</sup> Density functional theory (DFT) was applied using the BB1K,<sup>2</sup> B97-1,<sup>3</sup> B3LYP,<sup>4-7</sup> and M06-2X<sup>8</sup> functionals in combination with the 6-31++G\*\* basis set. Geometry optimizations were carried out in the solvent phase (CPCM, UFF radii, water) for BB1K, B3LYP, and M06-2X without any constraints. Test calculations of pK<sub>b</sub> values were done with the B97-1 functional and the SMD<sup>9</sup> solvation model. The SMD model was generally used for the calculation of solvation energies. All calculations employed the tight convergence criteria and the ultrafine grid in Gaussian09. Harmonic vibrational frequency calculations were performed at the same level as the geometry optimizations. Zero-point energies (EZPC), enthalpies (H), and free energies (G) at 298.15 K and 1 atm were determined from these calculations. The number of imaginary modes was used to verify minima (no imaginary frequency) and transition states (one imaginary frequency). Intrinsic reaction coordinate (IRC)<sup>10,11</sup> calculations were performed to confirm the direct connection between transition states and minima. The programs Molden<sup>12</sup> and Gaussview 3.5<sup>13</sup> were used for visualization.

### Energetics: Comparisons between different functionals

Unless noted otherwise, the results in the main paper come from BB1K/6-31++G(d,p) calculations. For comparison, additional calculations were done at the following levels: L1 = BB1K/6-311++G(3df,3pd), L2 = B3LYP/6-31++G(d,p), and L3 = M06-2X/6-31++G(d,p). The computed total energies are documented in Tables SI2-SI4, and selected energy profiles are shown in Figures SI7-SI10.

As pointed out in the main paper, the Gibbs relative free energies from BB1K/6-31++G(d,p) for structures **1**, **3-6** and **10-16** are well reproduced at the other levels, with small standard deviations of 2.3 (L1), 2.2 (L2), and 1.0 (L3) kcal/mol. In the case of structures **17-25**, geometry optimizations at levels L2-L3 sometimes failed (*e.g.*, when trying to locate the transition state for the required conformational change or C(1)O(1) dissociation); similar problems have been met in related systems.<sup>14</sup> The comparisons for structures **17-25** are thus restricted to single-point calculations, which give standard deviations of 1.7 (L1), 4.2 (L2), and 10.2 (L3) kcal/mol relative to BB1K/6-31++G(d,p). The B3LYP results (L2) are consistent with the well-known tendency of this functional to underestimate barriers. In previous benchmarks for barrier heights, the following mean signed errors (MSE) relative to experiment were reported: BH42/04 database, MSE(B3LYP/MG3S) = -4.4 kcal/mol, MSE(BB1K/MG3S) = -0.61 kcal/mol;<sup>15</sup> BH6 database, MSE(B3LYP/MG3S) = -4.72 kcal/mol, MSE(BB1K/MG3S) = -1.03 kcal/mol;<sup>15</sup> HTBH38/04 and NHTBH38/04 database, MSE(B3LYP/MG3S) = -4.15 kcal/mol, MSE(BB1K/MG3S) = -0.03 kcal/mol.<sup>16</sup> The large deviations of the M06-2X results (L3) for **17-25** are unexpected, however, since this functional usually provides rather accurate results for thermochemistry (TC177 database, mean unsigned errors: MUE(B3LYP) = 1.39 kcal/mol, MUE(M06-2X) = 0.82 kcal/mol) and for barrier heights (DBH76 database, MUE(B3LYP) = 4.50 kcal/mol, MUE(M06-2X) = 1.22 kcal/mol).<sup>17</sup>

## Solvation model

We use the Conductor-like Polarizable Continuum Model (CPCM) for aqueous solvation. In a benchmark study<sup>18</sup> of several solvation models, CPCM was found to give solvation free energies with the lowest mean absolute deviation (MAD) from the experimental values for a set of 70 small neutral and charged organic molecules (MAD = 3 kcal/mol), superior to those from a cluster-continuum model (MAD = 9 kcal/mol), COSMO (MAD = 9 kcal/mol), SM5.24R (MAD = 8 kcal/mol), PCM (MAD = 11 kcal/mol), and IPCM (MAD = 20 kcal/mol). For cations and neutral species that are studied presently, CPCM performs best using UAKS cavities (United Atom Topological Model applied on radii optimized for the PBE1PBE/6-31G(d) level of theory,  $MAD_{cation} = 4$  kcal/mol,  $MAD_{neutral} = 1$  kcal/mol). However, when using these UAKS cavities or other United Atom cavities (UAKS, UAHF, or UA0), geometry optimization on some of the charged species failed and the error on total polarization charges (value of the density outside of the generated cavity) exceeded 0.05 by far. On the other hand, these structures could be optimized with Pauling cavities (Merz-Kollman radii) and Bondi radii ( $MAD_{cation} \approx 5$  kcal/mol,  $MAD_{neutral} \approx 3$  kcal/mol), but the error on total polarization charges still exceeded 0.05. Only the use of universal force field (UFF) cavities (with explicit cavities for hydrogen atoms) yielded low errors on polarization charges, but led to larger deviations ( $MAD_{cation} = 15$  kcal/mol,  $MAD_{neutral} = 8$  kcal/mol) from experimental solvation free energies in the benchmark study.<sup>18</sup> Therefore the CPCM model was used for calculations on the reaction pathway, but was not used for the calculation of the solvation energies (see below).

Table SI1 lists CPCM solvation free energies for structures **1**, **3-6**, **10-16** and **41**, as obtained with UFF, Pauling, and Bondi cavities. Compared with the UFF-based values, we find standard deviations of 2.0 kcal/mol for Pauling cavities ( $STD_{neutral} = 0.7$  kcal/mol;  $STD_{cation} = 2.7$  kcal/mol) and of 1.5 kcal/mol for Bondi cavities ( $STD_{neutral} = 1.1$  kcal/mol;  $STD_{cation} = 1.8$  kcal/mol), which are much lower than expected from the errors mentioned above.

**Table SI1. Solvation free energies (kcal/mol) relative to structures **1** and **10** (BB1k/6-31++G(d,p), water, 298.15 K, 1 atm) for different choices of CPCM cavities (see text).**

## Transition states with low frequencies

In the transition states for the conformational changes of structure **10** to either **17**, **18**, or **19**, we find small imaginary frequencies ( $\sim 60i\text{ cm}^{-1}$ ) that are typical for such low-barrier processes. The IRC calculations for these three transition states were unsuccessful, since they failed to converge after a few steps, even when the step sizes were varied between 0.05 to 0.2 Bohr. We note, however, that these three transition structures correspond to maxima of relaxed scans (see Figures SI1-SI3) and that optimizations starting from geometries obtained by manually displacing these structures along the transition vector in either direction end up either at **10** or at **17**, **18**, or **19**.

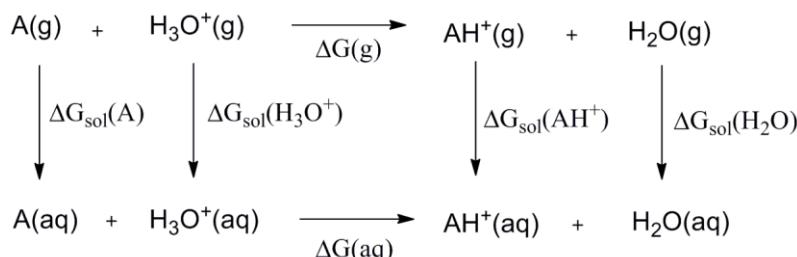

## Calculations with thermodynamic pathways

Thermodynamic cycles were used to determine  $pK_b$  values, reaction free energies, and energies for bringing reactants together from infinity.

Calculation of  $pK_b$  values: The thermodynamic cycles corresponding to reaction (1) and (2) yield consistent  $pK_b$  values, with differences of 0.1  $pK_b$  units or less (A= cellobiose).

Shown below is the thermodynamic pathway for reaction (2):

The required DFT calculations employed the BB1K functional. Previous benchmark calculations indicate that other functionals might provide more accurate solvation free energies: for example, in a comparative study on 30 acids using G-n and CBS methods as well as several DFT functionals, B97-1 performed best among the latter (MAD = 1 kcal/mol relative to experiment).<sup>19</sup> Hence, we also carried out some B97-1 calculations for validation, but the corresponding  $pK_b$  values showed little improvement over the BB1K results, and therefore we adopted the BB1K functional also here, for the sake of consistency. Changes in solvation free energies were calculated by subtracting the BB1K free energy in vacuum from the BB1K free energy calculated with the SMD solvent model. The latter was chosen because its documented good performance for solvation free energies, for instance, in a benchmark study on a set of 51 drug-like molecules (RMSD = 2.5 kcal/mol relative to experiment).<sup>9</sup> In the case of structure **10**, the gas-phase geometry optimization terminated because of SCF convergence problems, and the gas-phase energy was therefore estimated by a single-point calculation.

For the evaluation of the thermodynamic cycle, we used experimental values for the solvation free energy of hydronium ion,  $H^+$ , and water molecule,<sup>20,21</sup> and for the gas-phase free energy of  $H^+$ :<sup>22</sup>  $\Delta G_{sol,1M}(H_2O) = -6.32$  kcal/mol,  $\Delta G_{sol,1M}(H_3O^+) = -110.3$  kcal/mol,  $\Delta G_{sol,1M}(H^+) = -265.9$  kcal/mol,  $\Delta G_{g,1atm}(H^+) = -6.28$  kcal/mol. All energy values were converted to the standard state of 298 K and 1 M (1 mol/L). In the gas phase, equation (3), the change of 1 mole of ideal gas from 1 atm (24.46 L/mol) to 1 M gives rise to the following correction term:

$$\begin{aligned}\Delta G_{g,1M} &= \Delta G_{g,1atm} - T\Delta S \\ &= \Delta G_{g,1atm} + RT\ln\left(\frac{V_g}{V_{aq}}\right) \\ &= \Delta G_{g,1atm} + RT\ln(24.46) \\ &= \Delta G_{g,1atm} + 1.89 \text{ kcal/mol}\end{aligned}\tag{3}$$

Likewise, bringing n water molecules from the concentration of 55.34 M in liquid water to 1M generates another correction term:

$$n \cdot \Delta G_{aq,1M}^*(H_2O) = -n \cdot RT\ln(55.34) = -2.38 \cdot n \text{ kcal/mol}\tag{4}$$

Combining equations (3) and (4) with the thermodynamic cycle for reaction (2) leads to:

$$\begin{aligned}\Delta G(aq) &= \Delta G_g + \Delta \Delta G_{sol} + n\Delta G_{aq,1M}^*(H_2O) \\ &= G_g(H_2O) + G_g(AH^+) - G_g(A) - G_g(H_3O^+) + \\ &\quad \Delta G_{sol}(H_2O) + \Delta G_{sol}(AH^+) - \Delta G_{sol}(A) - \Delta G_{sol}(H_3O^+) + 2.38 \text{ kcal/mol}\end{aligned}\tag{5}$$

The  $pK_b$  value is defined as:

$$pK_b = \frac{\Delta G(aq)}{RT\ln(10)}\tag{6}$$

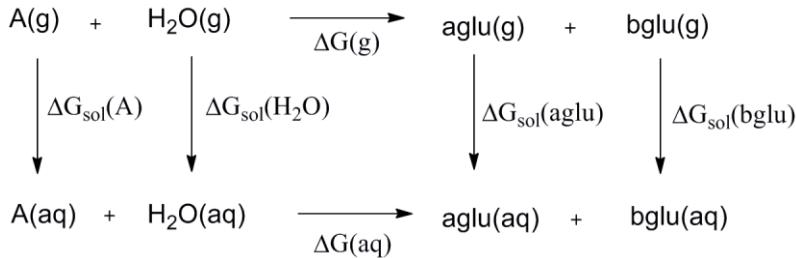

and  $pK_b$  differences between two molecules 1 and 2 are given by:

$$\Delta pK_b = \frac{\Delta G_1(aq) - \Delta G_2(aq)}{RT\ln(10)}\tag{7}$$

Calculation of reaction free energy: To obtain the reaction free energy of reaction (8),

the following thermodynamic cycle was set up (aglu=  $\alpha$ -glucose, bglu =  $\beta$ -glucose, A=cellobiose):

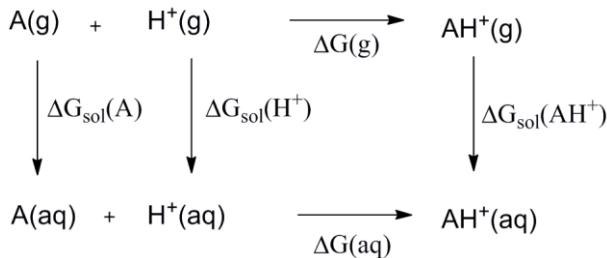

The reaction free energy is given by equation (9)

$$\begin{aligned} \Delta G(\text{aq}) &= \Delta G_g + \Delta \Delta G_{\text{sol}} + n \Delta G_{\text{aq},1\text{M}}^*(\text{H}_2\text{O}) \\ &= G_g(\text{aglu}) + G_g(\text{bglu}) - G_g(\text{A}) - G_g(\text{H}_2\text{O}) + \\ &\quad \Delta G_{\text{sol}}(\text{aglu}) + \Delta G_{\text{sol}}(\text{bglu}) - \Delta G_{\text{sol}}(\text{A}) - \Delta G_{\text{sol}}(\text{H}_2\text{O}) + 2.38 \text{ kcal/mol} \end{aligned} \quad (9)$$

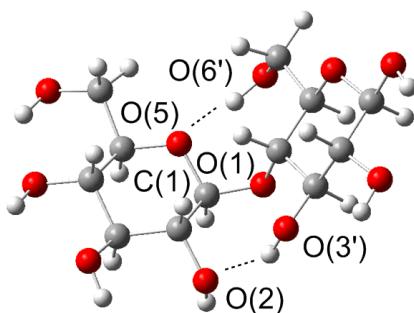

The gas-phase free energies and the solvation free energies in this expression were calculated with the BB1K functional and the SMD solvent model. For water the experimental solvation energy was used (see above).

Calculation of the free energy needed to bring reactants together from infinity: In this case, the reactants are cellobiose (A) and a proton, which form species **10** in a protonation reaction (10). The gas-phase free energies and the solvation free energies in equation (11) were calculated with the BB1K functional and the SMD solvent model. For the proton the experimental solvation energy was used (see above).

$$\begin{aligned} \Delta G(\text{aq}) &= \Delta G_g + \Delta \Delta G_{\text{sol}} \\ &= G_g(\text{AH}^+) - G_g(\text{A}) - G_g(\text{H}^+) - 1.89 \text{ kcal/mol} + \\ &\quad \Delta G_{\text{sol}}(\text{AH}^+) - \Delta G_{\text{sol}}(\text{A}) - \Delta G_{\text{sol}}(\text{H}^+) \end{aligned} \quad (11)$$

## Results for the rotated conformer structure **41**

**41**

**Figure SII.** Optimized structure of **41** (BB1K/6-31++G\*\*).

Structure **41** is one of the possible conformers of cellobiose, which can be reached from structure **1** by rotation around the C(1)-O(1) bond. It is often regarded as one of the most stable conformers of cellobiose in vacuum,<sup>23,24</sup> but it is less relevant for the purposes of the present study. Therefore, we present computational results for **41** only in the Supporting Information. Its relative free energy, important bond lengths and dihedral angles (Table SI2), NBO data (Table SI3), and protonation energies (Table SI4) are given below in comparison to the other conformers **1** to **6**.

Conformer **41** contains the atoms H(1) and H(4') located *anti* to each other in the plane formed by the glycosidic linkage C(1)O(1)C(4'). It has two intramolecular H-bonds, O(5)···HO(6') and O(2)···HO(3'). NBO analysis reveals that the corresponding donor-acceptor interactions,  $n_{O(5)} \rightarrow \sigma^*_{O(6')H}$  and  $n_{O(2)} \rightarrow \sigma^*_{O(3')H}$ , contribute 6.5 and 8.6 kcal mol<sup>-1</sup> to the stabilization of **41**, respectively (Table SI14, entry 41); the occupancies of  $\sigma^*_{O(3')H}$  and  $\sigma^*_{O(6')H}$  are 0.026 and 0.027 electrons (*e*). The exo-anomeric effect provides an even stronger interaction stabilizing **41** by 14.1 kcal mol<sup>-1</sup>, with an occupancy of  $\sigma^*_{C(1)O(5)}$  of 0.056 *e*.

By contrast, the endo-anomeric effect is only of marginal importance, as indicated by the low stabilization (3.9 kcal mol<sup>-1</sup>) and the lower occupancy of  $\sigma^*_{C(1)O(1)}$  (0.034 *e*). Rotation around the C(1)O(1) bond may convert conformer **41** into **1**. A relaxed scan for this rotation indicates an energy barrier of about 10 kcal mol<sup>-1</sup> (see the computed energy profile, Figure SI5), but the transition state could not be located precisely. Recent dynamic studies do not report transitions between **41** and **1**.<sup>23,25</sup>

Table SI2. Gibbs free energies  $\Delta\Delta G$  (kcal mol<sup>-1</sup>) relative to structure **1**, selected torsional angles and bond lengths for structures **1** to **6** and **41** (BB1K/6-31++G\*\*).

\*[O(X)-H]<sup>+</sup> distance fixed at 0.98 Å. In 5 and 6 the torsional angle  $\phi$  is generally fixed at 0° and 180°, respectively.

## Reaction mechanism A1 and A2 for 4-O-methyl-celllobiose

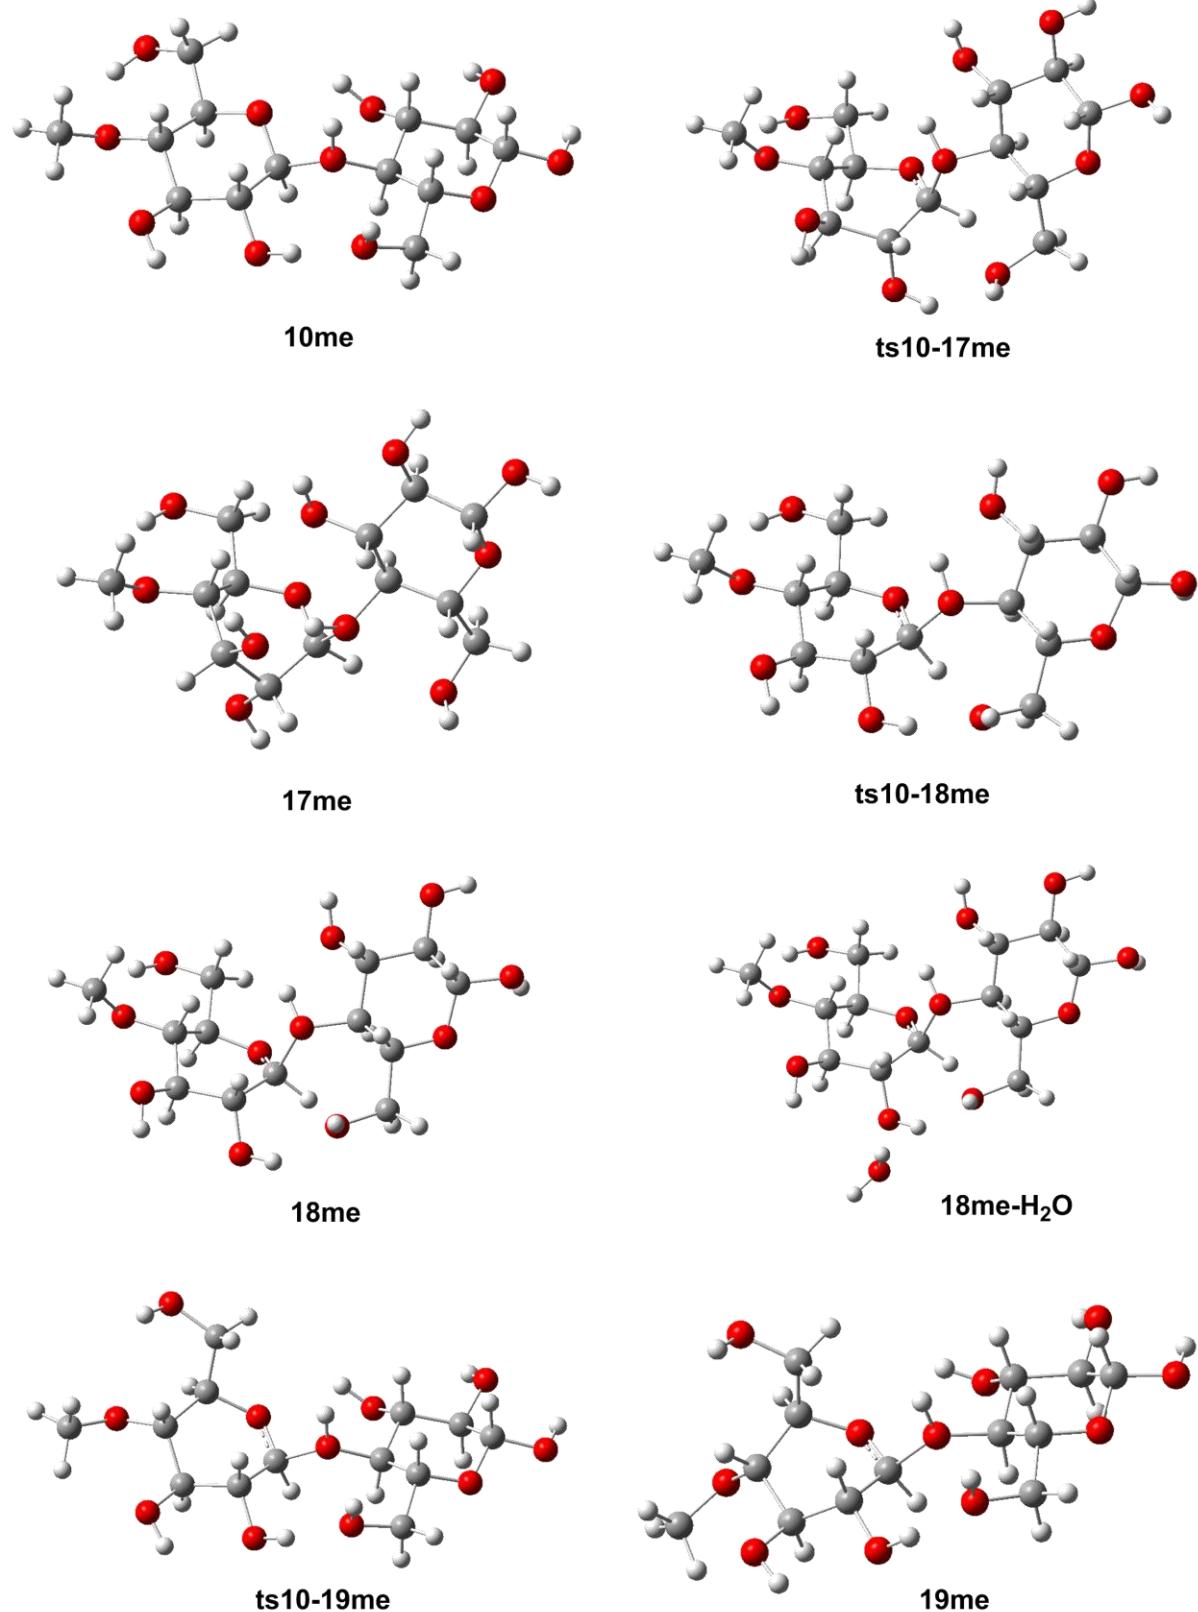

To validate the mechanism found for structure **1**, the A1 and A2 pathways were also calculated with a 4-O-methyl-celllobiose model to assess the influence of an additional methyl group. Results are collected in Table SI5 (energies), Figure SI2 (energy profile) and Figure SI3 (structures). The relative free energies of the pathways deviate by at most 1.8 kcal/mol (compared with **1**), and the overall trends are conserved.

**Table SI5.** Relative free energies for the A1 and A2 pathways for 4-O-methyl-celllobiose. BB1K/6-31++G\*\*, CPCM water, 298.15 K, 1 atm.

## Results and reaction mechanism A1 for structure 2

To validate the mechanism found for structure **1** (with an O(2)-H $\cdots$ O(6') hydrogen bond) the A1 pathway was also calculated for structure **2** (with an O(2) $\cdots$ H-O(6') hydrogen bond) to assess the influence of different hydrogen bond networks. Results are listed in Table SI6 (energies), Figure SI4 (energy profile), and Figure SI6 (structures). The energies along the pathways deviate by at most 2.6 kcal/mol (compared with **1**), and the overall trends are conserved.

No fully optimized structure for **TS(17'-20')** could be obtained, for the same reasons as discussed in the paper for structure **1**.

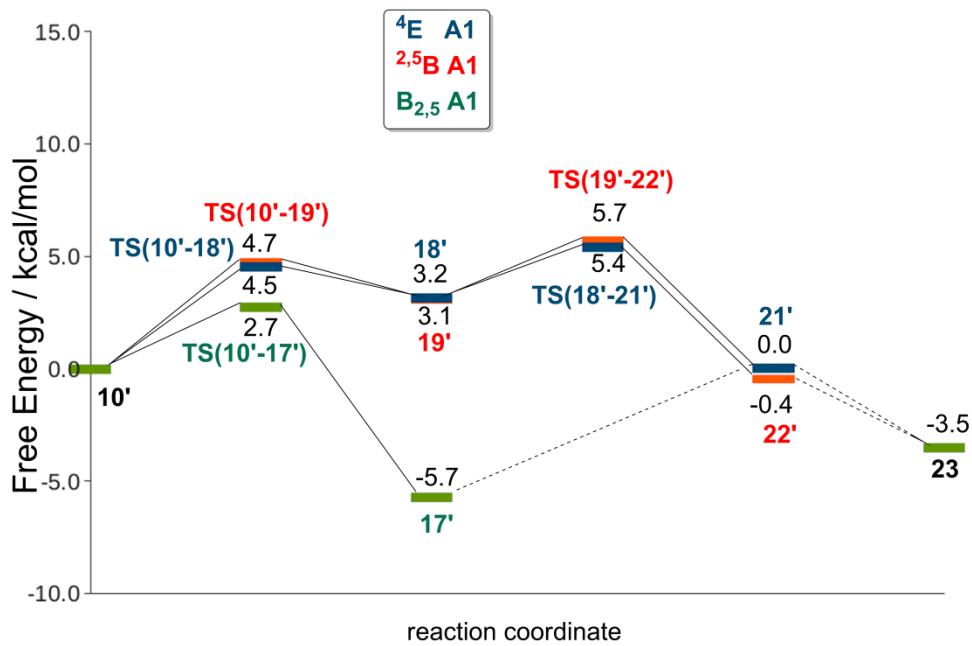

Figure SI5 shows the different hydrogen bond networks obtained upon protonation of O(2) in structures **1** and **2**.

**Table SI6.** Relative free energies for the A1 pathways for structure 2. BB1K/6-31++G\*\*, CPCM water, 298.15 K, 1 atm.

## PES Scans

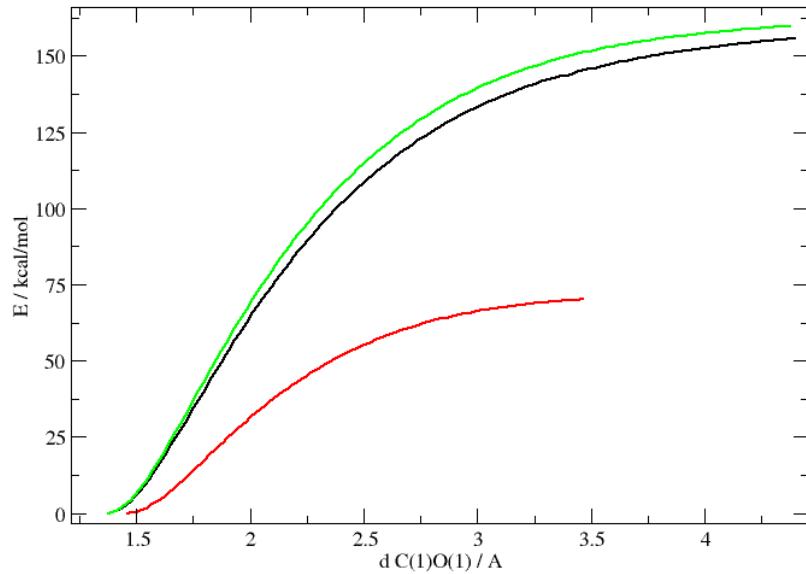

**Figure SI7:** Relaxed PES scan energy profile (BB1K/6-31++G(d,p)). Elongation of  $O(1)H(4)$  distance in structure **18**. Energies refer to structure **10**. The abrupt change in energy at 3.73 Å is caused by the change from endo-sofa to chair conformation, with a shortening of the  $C(1)O(1)$  distance and a flip of  $C(6)$  from nearly axial to equatorial position.

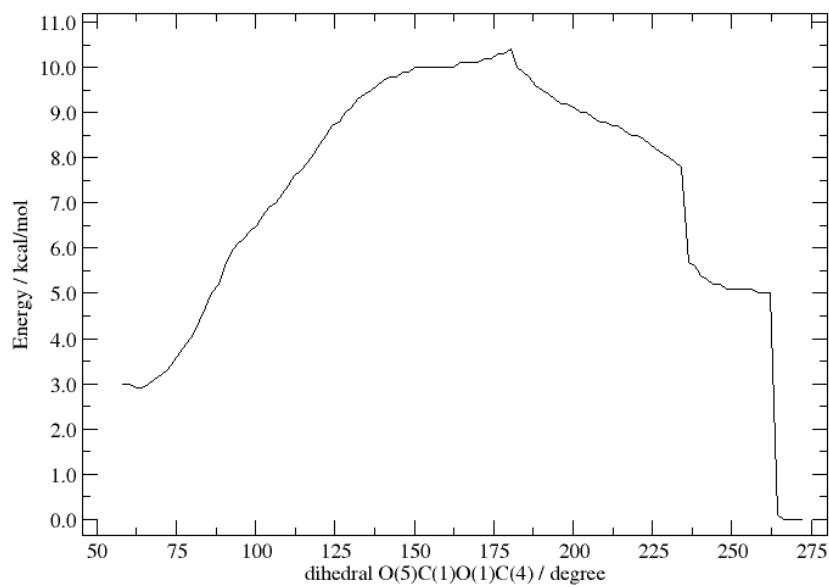

**Figure SI8:** Relaxed PES scan energy profile (BB1K/6-31++G(d,p)). Rotation of  $O(4)C(4)C(5)C(6)$  dihedral in structure **10**. Energies refer to structure **10**.

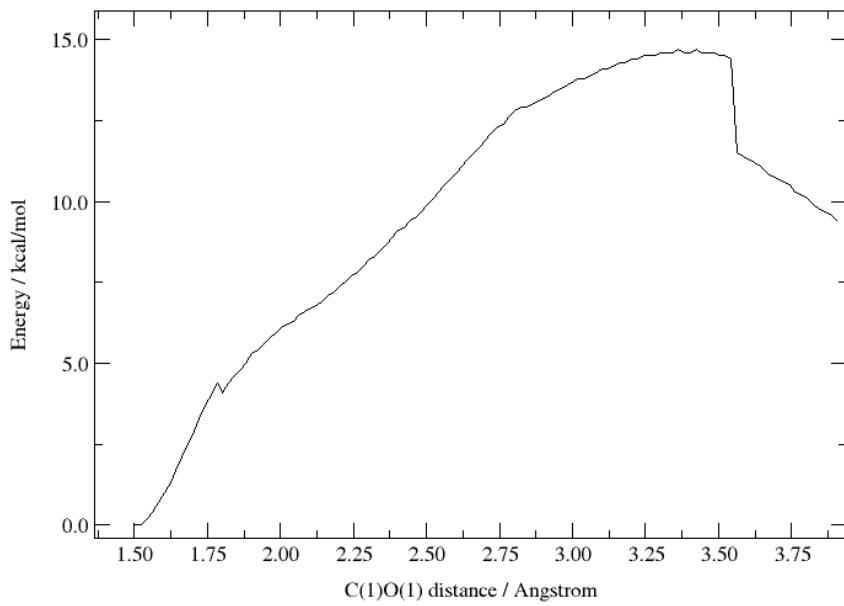

**Figure SI9:** Relaxed PES scan energy profile (BB1K/6-31++G(d,p)). Rotation of  $O(2)C(2)C(3)O(3)$  dihedral in structure **10**. Energies refer to structure **10**. The abrupt energy change at  $138^\circ$  comes from  $O(2)$  moving into axial position and an increase of the  $C(1)O(1)$  distance. The abrupt change in energy at  $160^\circ$  is caused by the formation of a hydrogen bond between  $HO(1)$  and  $O(3)$ .

**Figure SI10:** Unrelaxed open-shell PES scan energy profile (BB1K/6-31++G(d,p)). Elongation of  $C(1)O(1)$  distance in structures **1** (black), **10** (red), and **16** (green). Energies refer to starting structure.

**Figure SI11:** Relaxed PES scan energy profile (BB1K/6-31++G(d,p)). Rotation of O(5)C(1)O(1)C(4) dihedral in structure **41**. Energies refer to structure **1**. The abrupt changes in energy at 234° and 254° come from the formation of the O(6')O(2) and O(3')O(5) hydrogen bonds, respectively.

**Figure SI12:** Relaxed PES scan energy profile (BB1K/6-31++G(d,p)). Elongation of C(1)O(1) distance in structure **17**. Energies refer to structure **17**. The abrupt energy change at 3.54 Å is caused by the formation of a hydrogen bond between HO(6') and O(1).

## Energy profiles for exo-cyclic mechanisms with different functionals and basis sets

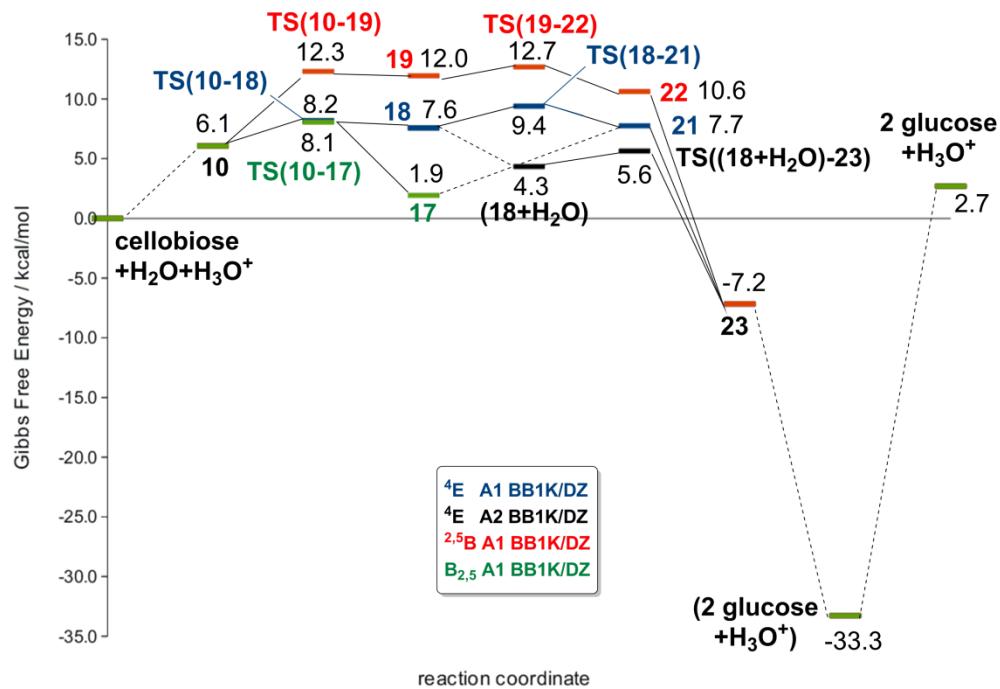

Figure SI13: Energy profile (BB1K/6-31++G(d,p)) for exo-cyclic mechanisms. Energies refer to structure  $\mathbf{1}+\text{H}_2\text{O}+\text{H}_3\text{O}^+$ .

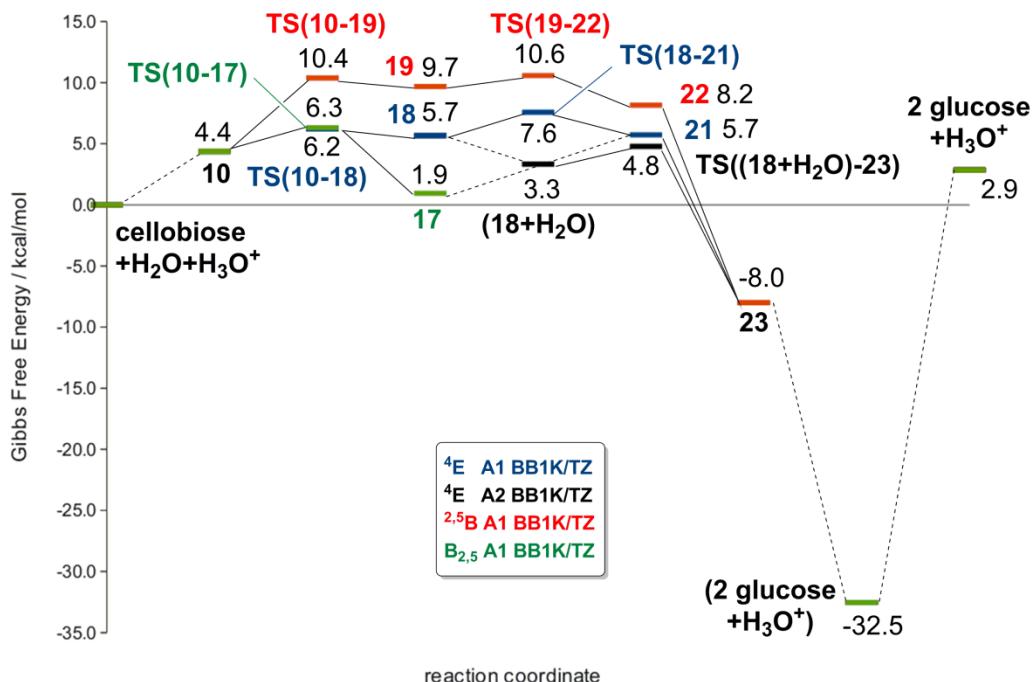

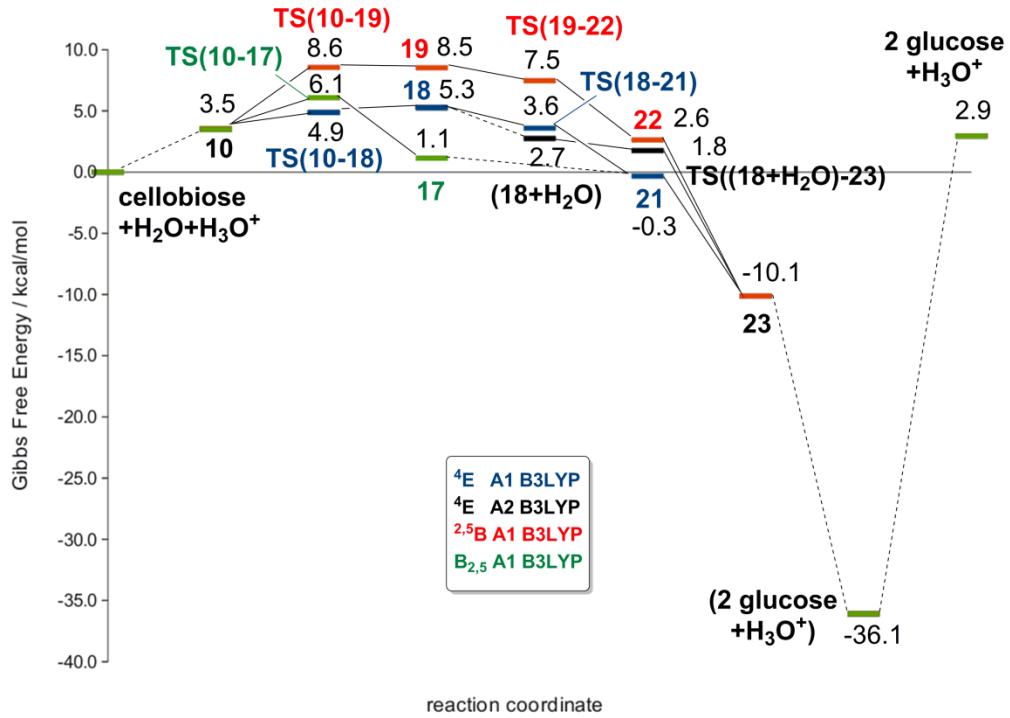

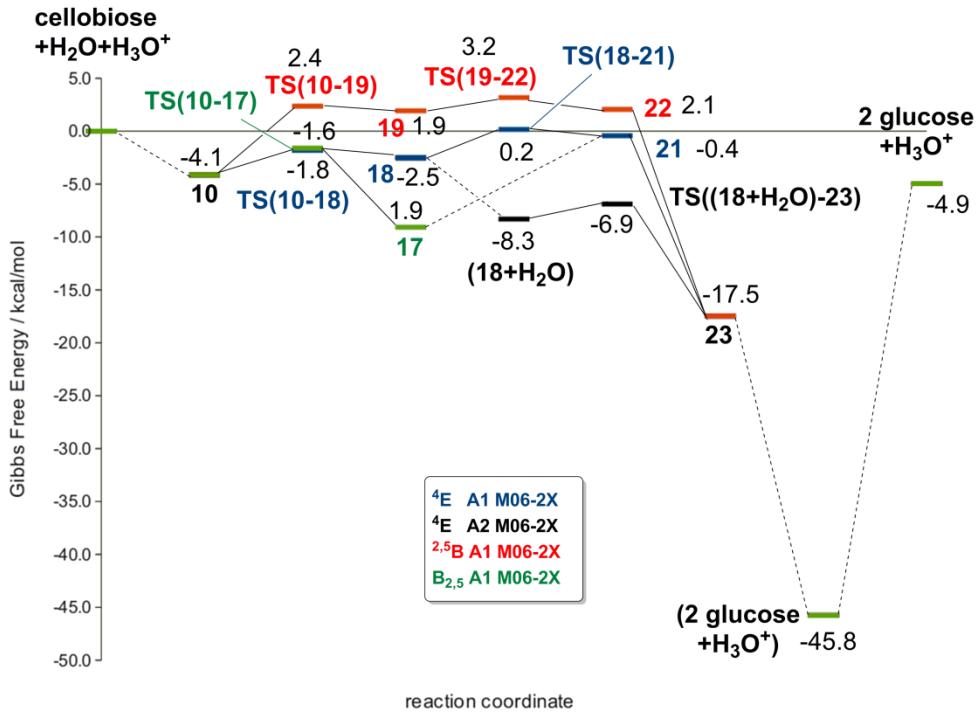

Figure SI14: Single-point energy profile (BB1K/6-311++G(2df,2pd)) for exo-cyclic mechanisms. Energies refer to structure  $\mathbf{1}+\text{H}_2\text{O}+\text{H}_3\text{O}^+$ .

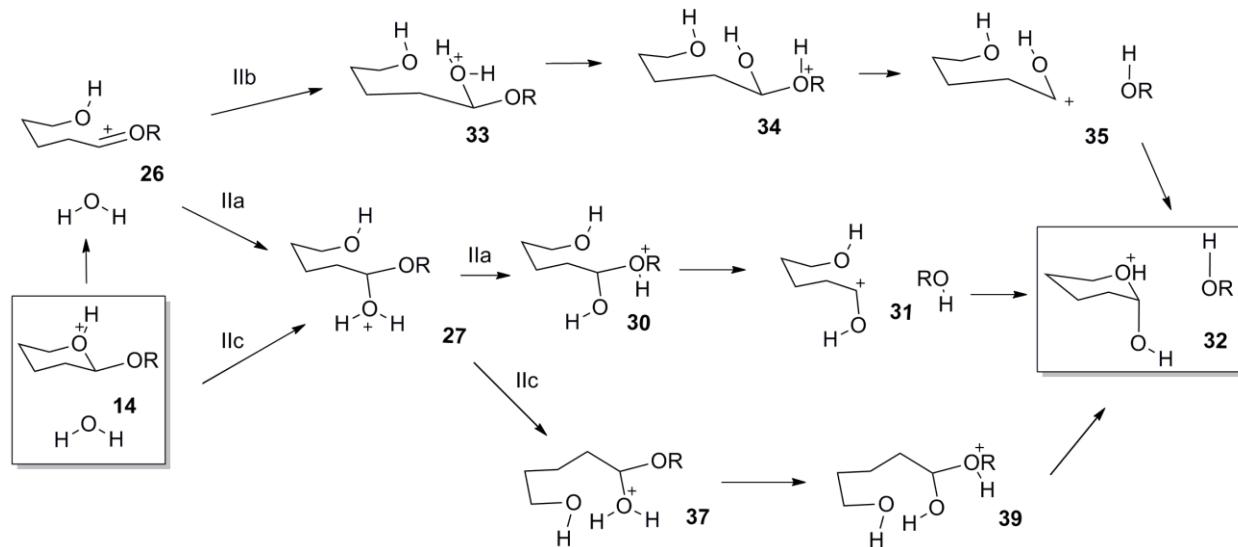

**Figure SI15:** Single-point energy profile (B3LYP/6-31++G(d,p)) for exo-cyclic mechanisms. Energies refer to structure  $\text{1} + \text{H}_2\text{O} + \text{H}_3\text{O}^+$ .

**Figure SI16:** Single-point energy profile (M06-2X/6-31++G(d,p)) for exo-cyclic mechanisms. Energies refer to structure  $\text{1} + \text{H}_2\text{O} + \text{H}_3\text{O}^+$ .

## Reaction scheme and energy profiles for endo-cyclic mechanism for structure 1

Scheme SI17. A1 and A2 pathways for cellobiose in the endo-cyclic mechanism.

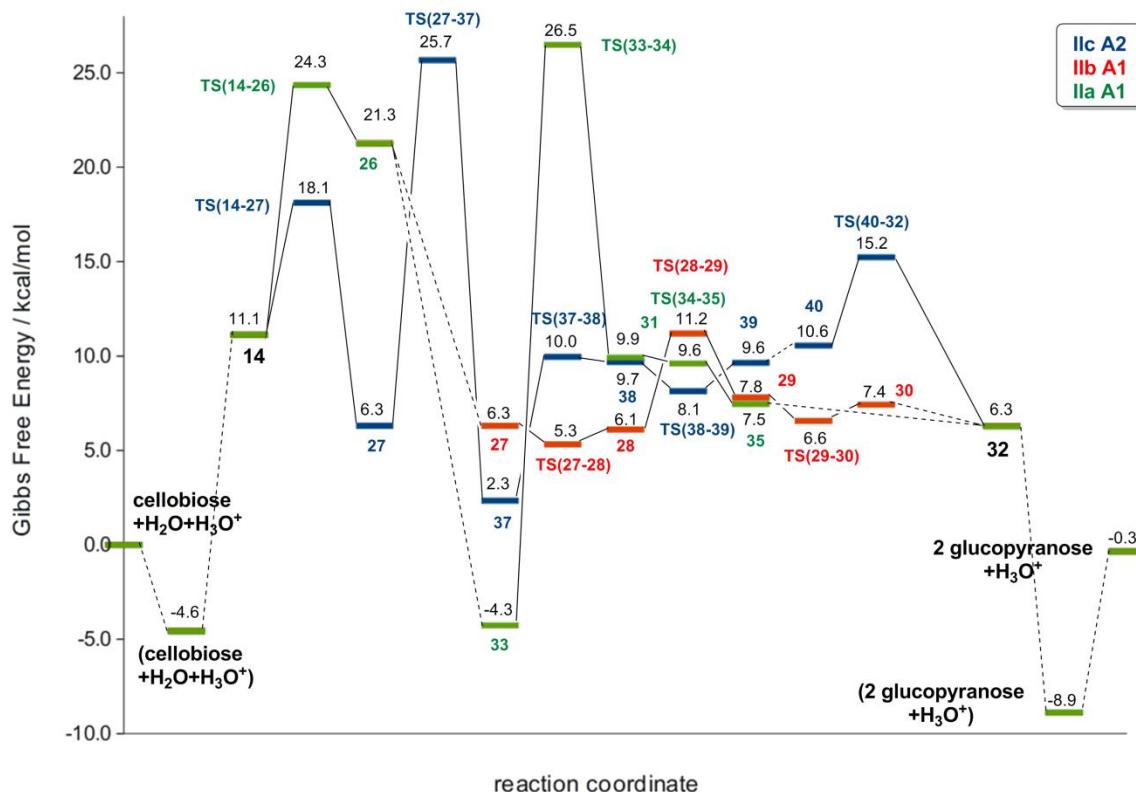

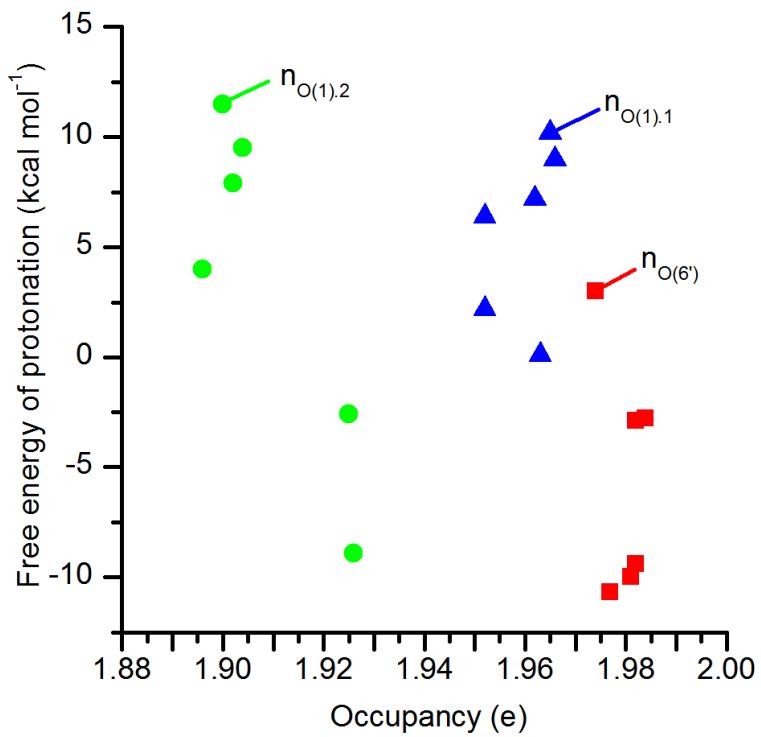

Figure SI18. Energy profile for A1 and A2 pathways for cellobiose for the endo-cyclic mechanism (BB1K/6-31++G(d,p)).

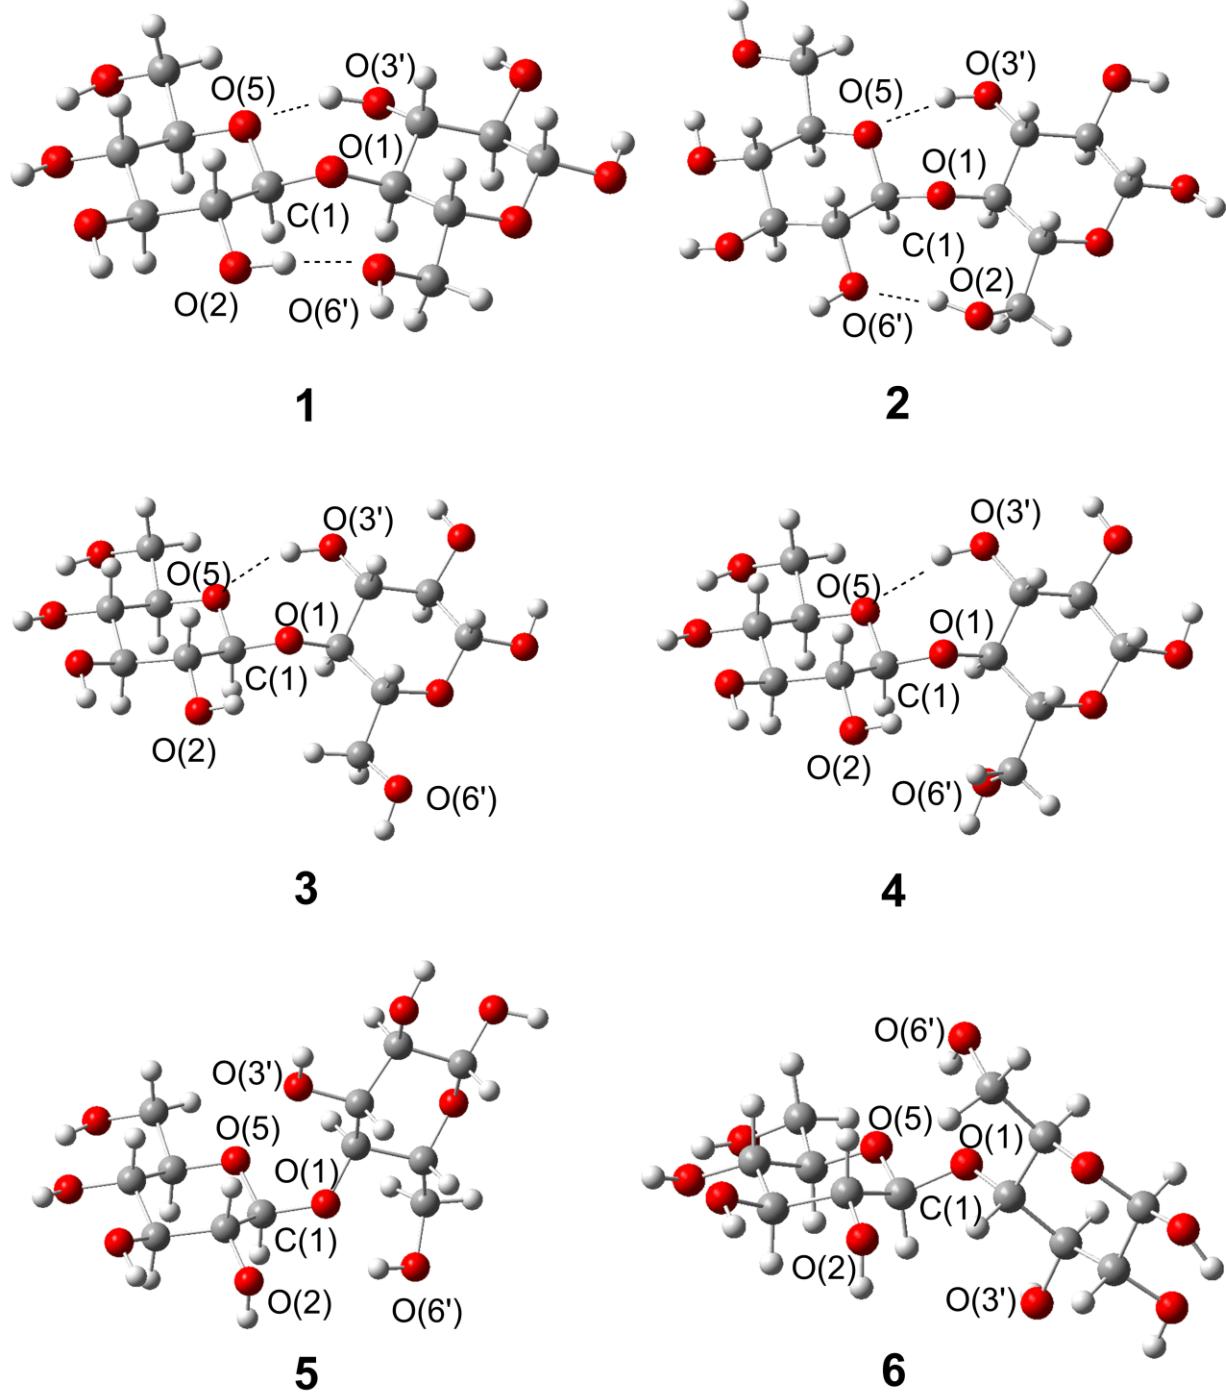

## Additional Figures

Figure SI14 shows an attempt to correlate the computed protonation free energy of structures **1**, **3** to **6** and **41** with the occupancy of the corresponding oxygen lone pairs.

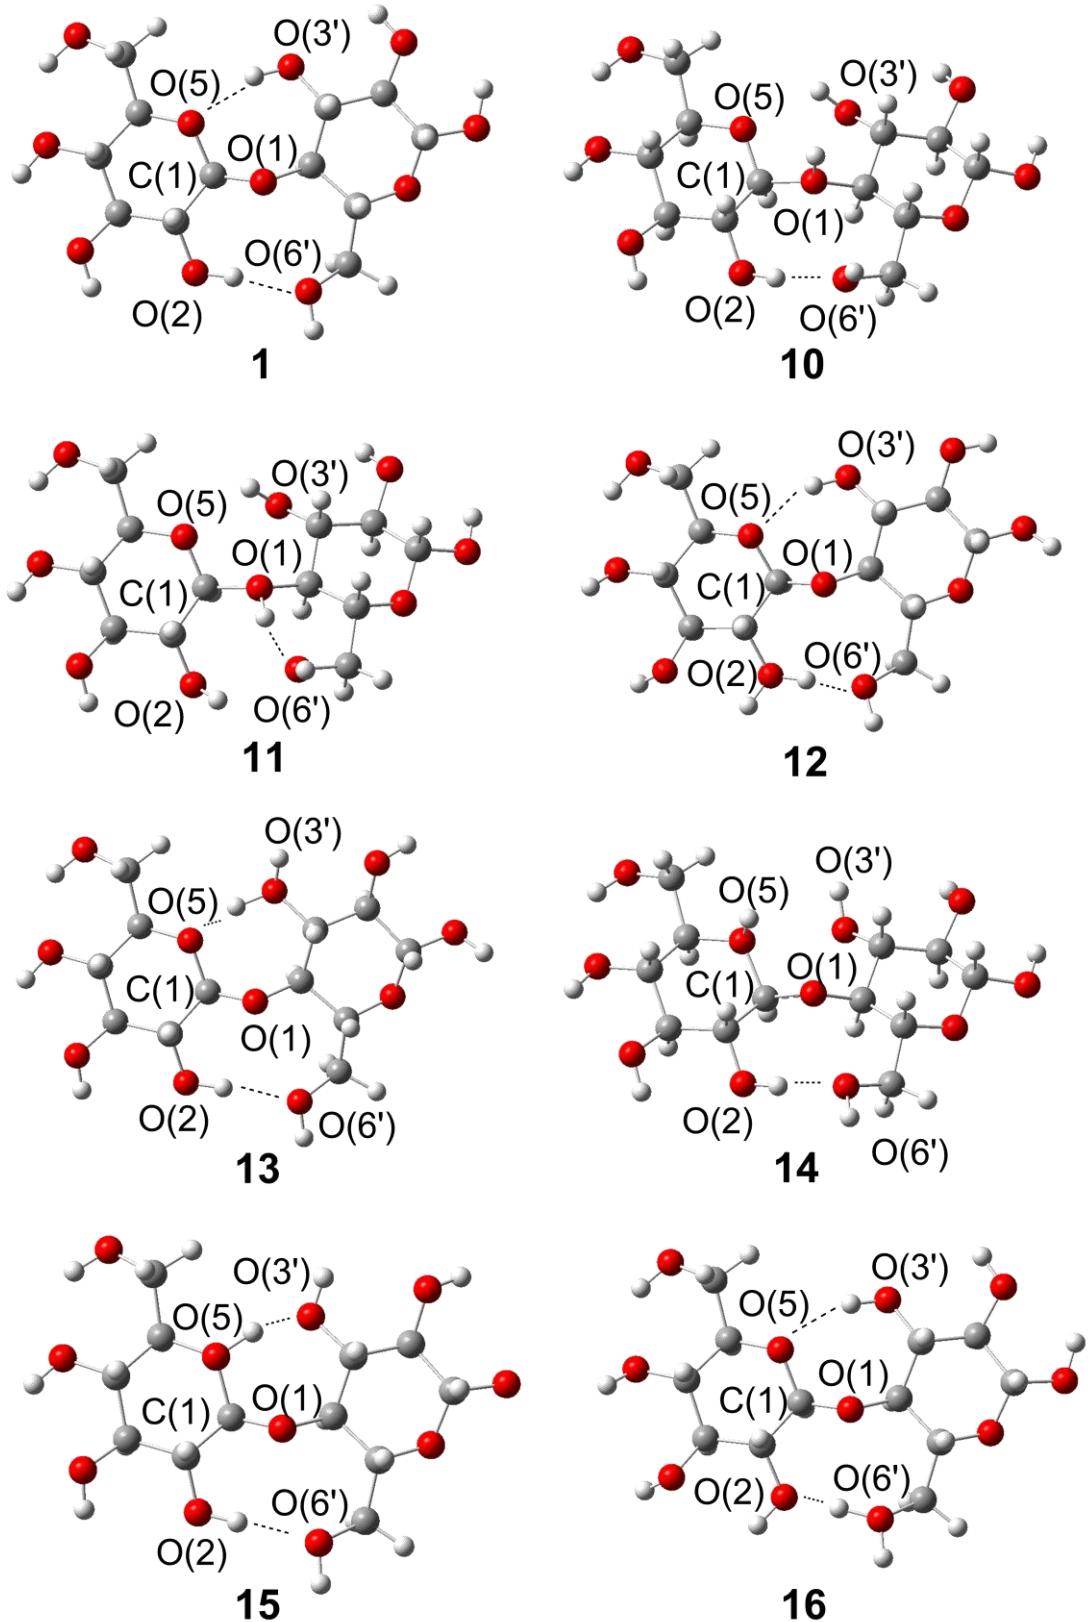

Figures SI15 and SI16 are enlarged versions of Figures 4 and 8 of the main paper, respectively, that are included to provide a better view of these structures.

**Figure SI19.** Correlation of the free energy of protonation versus the occupancy of the O(1)-1, O(1)-2 and O(6) lone pairs in **1**, **3** to **6** and **41**.

**Figure SI20.** Optimized structures of the cellobiose conformers **1** to **6** (BB1K/6-31++G\*\*).

**Figure SI21.** Optimized structures of **1** protonated at different sites (BB1K/6-31++G\*\*).
