^aLeft column for each temperature. ^bRight column for each temperature. The cross-peaks volumes were corrected according to the formula: $V_{\text{cor}} = V_m / (\sin\delta_i \sin\delta_j - 0.5 * \cos\delta_i \cos\delta_j)$, where V_{cor} and V_m are corrected and measured cross-peak volumes respectively, and δ_i and δ_j are angles the spin lock axis of the spins i and j form with z axis. The peak volumes in all spectra were scaled to the II1/II2 cross peak volume. ^cThe spectra were recorded under the following conditions: GM1: 307 K, B_1 (frequency 2.65 KHz, offset 6.4 ppm), mixing time 155 ms; 293 K, B_1 (2.6 kHz, 5.8 ppm), mixing time 80 ms; deac-GM1: 297 K, B_1 (2.4 kHz, 5.5 ppm), mixing time 100 ms; 293 K, B_1 (2.4 kHz, 5.5 ppm), mixing time 150 ms. ^d not detected due to spectral overlap.
