

Suppl. Fig. 2: Locomotor activity onsets in LD.

Locomotor activity onsets (average of 4 days) of control (*Syt10^{Cre/Cre} Bmal1^{+/-}*) and mutant mice (*Syt10^{Cre/Cre} Bmal1^{fl/-}*) under bright (350 lx) and dim light (~10 lx) LD 12:12 conditions. 8 mice were analyzed per genotype. Lights off was at 12:00 h. *: $p < 0.05$ vs. bright light onsets in the same genotype (2-way ANOVA with Bonferroni post-test). All other post-hoc comparisons were not significant.
