Received 23 July 2012; accepted 2 August 2012

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.012 \text{ \AA}$; R factor = 0.084; wR factor = 0.209; data-to-parameter ratio = 14.2.

The asymmetric unit of the title compound, $[\text{Cu}(\text{C}_{21}\text{H}_{24}\text{N}_2\text{O}_2)] \cdot \text{H}_2\text{O}$, comprises half of a Schiff base complex and half of a water molecule. The whole compound is generated by crystallographic twofold rotation symmetry. The geometry around the Cu^{II} atom, located on a twofold axis, is distorted square-planar, which is supported by the N_2O_2 donor atoms of the coordinating Schiff base ligand. The dihedral angle between the symmetry-related benzene rings is $47.5(4)^\circ$. In the crystal, the water molecule that is hydrogen bonded to the coordinated O atoms links the molecules via $\text{O}-\text{H}\cdots\text{O}$ interactions into chains parallel to [001]. The crystal structure is further stabilized by $\text{C}-\text{H}\cdots\pi$ interactions, and by $\pi-\pi$ interactions involving inversion-related chelate rings [centroid–centroid distance = $3.480(4) \text{ \AA}$].

{4,4'-Dimethyl-2,2'-[2,2-dimethylpropane-1,3-diylbis(nitrilomethanyliden)]diphenolato}copper(II) monohydrate

Hadi Kargar, Reza Kia, Fatemeh Ganji and Valiollah Mirkhani

Comment

Schiff base complexes are one of the most important stereochemical models in transition metal coordination chemistry, with the ease of preparation and structural variations (Granovski *et al.*, 1993; Blower, 1998). In continuation of our work on the structural analysis of Schiff base metal complexes (Kargar *et al.*, 2012; Kargar *et al.*, 2011; Ghaemi, *et al.*, (2011), we synthesized the title compound and report herein on its crystal structure.

The asymmetric unit of the title compound, Fig. 1, comprises half of a Schiff base complex and half a water molecule. The Cu^{II} and C9 atoms of the complex and the O atom of the water molecule lie on a two-fold rotation axis which generates the whole complex. The bond lengths (Allen *et al.*, 1987) and angles are within the normal ranges and are comparable to those reported for related structures (Kargar *et al.*, 2012; Kargar *et al.*, 2011; Ghaemi *et al.*, (2011)). The geometry around the Cu^{II} atom is distorted square-planar which is supported by the N₂O₂ donor atoms of the coordinated Schiff base ligand. The dihedral angle between the substituted benzene rings is 47.5 (4)^o.

In the crystal, the water molecule that is hydrogen bonded to the coordinated O atoms, O1, mediates linking of molecules by C—H···O interactions (Table 1 and Fig. 2). The crystal structure is further stabilized by C-H···π interactions (Table 1), and by π-π interactions involving inversion related chelate rings [$Cg\cdots Cg^i = 3.480 (4)$ Å; Cg is the centroid of the Cu1/O1/C1/C6/C7/N1 ring; symmetry code: (i) 1 - x, -y, -1 - z].

Experimental

The title compound was synthesized by adding 5-methyl-salicylaldehyde-2,2-dimethyl-1,3-propanediamine (2 mmol) to a solution of CuCl₂. 4H₂O (2.1 mmol) in ethanol (30 ml). The mixture was refluxed with stirring for 30 min. The resultant solution was filtered. Dark-green single crystals of the title compound suitable for X-ray structure determination were recrystallized from ethanol by slow evaporation of the solvents at room temperature over several days.

Refinement

The water H atom was located in a difference Fourier map and refined as a riding atom with $U_{iso}(H) = 1.5U_{eq}(O)$. The C-bound H-atoms were included in calculated positions and treated as riding atoms: C—H = 0.93, 0.96 and 0.97 Å for CH, CH₃ and CH₂ H-atoms, respectively, with $U_{iso}(H) = k \times U_{eq}(C)$, where k = 1.5 for CH₃ H-atoms, and = 1.2 for other H-atoms.

Computing details

Data collection: *APEX2* (Bruker, 2005); cell refinement: *SAINT* (Bruker, 2005); data reduction: *SAINT* (Bruker, 2005); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication:

SHELXTL (Sheldrick, 2008) and PLATON (Spek, 2009).

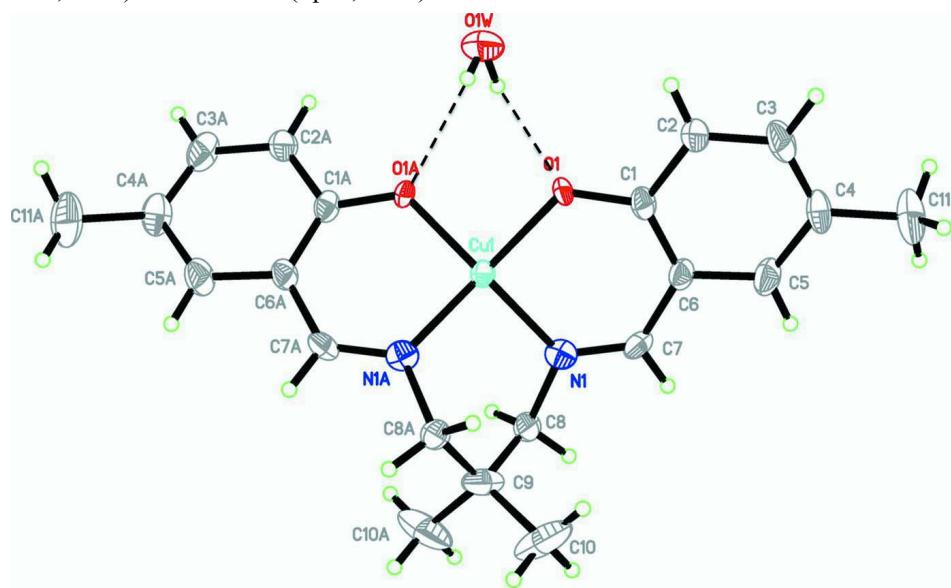

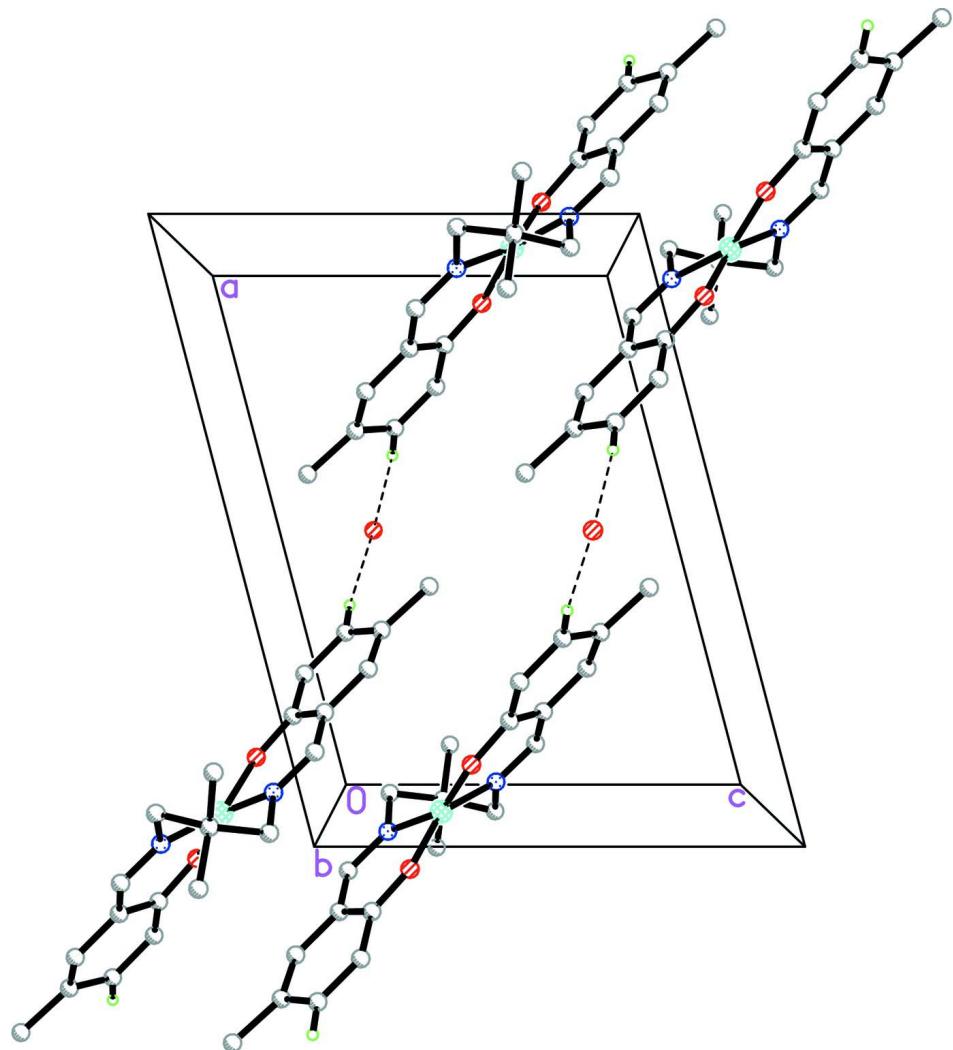

Figure 1

A view of the molecular structure of the title compound, with the atom numbering. The displacement ellipsoids are drawn at the 40% probability level. The O-H \cdots O hydrogen bonds are shown as dashed lines (see Table 1 for details; symmetry code for suffix A = $-x+1, y, -z-1/2$).

**Figure 2**

A view along the b axis of the crystal packing of the title compound showing the $C—H\cdots O$ interactions as dashed lines [see Table 1 for details; only the H atoms involved in these interactions are shown].

 $w = 1/[\sigma^2(F_o^2) + (0.0775P)^2]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 1.03 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.96 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

Symmetry code: (i) $-x+1, y, -z-1/2$.

Hydrogen-bond geometry (Å, °)

Cg1 is the centroid of the C1–C6 ring.
