## Supplementary Notes <br> Chemical synthesis

BDB synthesis was performed as described by Bonnert et al. ${ }^{1}$ with the last step following the procedure by Floyd et al. ${ }^{2}$

The synthesis of methyl 2-(3-bromo-2-methylphenyl)acetate was performed according to the procedure
 described by Winum et al. ${ }^{3}$ starting from 3-bromo-2-methylbenzoic acid (TCI). The synthesis of 1-(3-bromo-2-methylphenyl)-2-methylpropan-2-amine (1) was performed following the procedure of Glossop et al. ${ }^{4}$

Compound 2. $118 \mathrm{mg}(0.49 \mathrm{mmol})$ of 1-(3-bromo-2-methylphenyl)-
 2-methylpropan-2-amine (1) and $120 \mathrm{mg}(0.55 \mathrm{mmol})$ of $\mathrm{Boc}_{2} \mathrm{O}$ were dissolved under $0{ }^{\circ} \mathrm{C}$ in dry THF ( 2.5 ml ). The obtained solution was added gradually into another flask (at $-20^{\circ} \mathrm{C}$ or lower temperature) containing NaHMDS ( 0.46 ml of 1.9 M THF solution, $\sim 0.87 \mathrm{mmol}$,). The reaction mixture was stirred at below $-20^{\circ} \mathrm{C}$ for 45 min . Then cold $\left(0^{\circ} \mathrm{C}\right)$ sodium citrate buffer ( $\mathrm{pH} 4,20 \mathrm{ml}$ ) was added gradually to the reaction mixture. The reaction mixture was stirred for another 15 min at $0^{\circ} \mathrm{C}$. After warming up to the room temperature $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{ml})$ was added. The organic layer was separated, and the aqueous layer was extracted with ether $(2 \times 7 \mathrm{ml})$. The combined organic solutions were washed with brine $(10 \mathrm{ml})$, dried, and the solvent was evaporated in vacuo. TLC, hexane/EtOAc $2: 1, R_{\mathrm{f}}=0.7$; or in pure hexane $R_{\mathrm{f}}=0.2$. The product was isolated by flash column chromatography (Biotage SNAP Ultra 10 g ; gradient $0 \%$ to $30 \%$ of ethyl acetate in hexane). Yield - 125 mg ( $75 \%$ ) of yellowish solid.
