## 1. General Experimental Notes

Unless otherwise stated, all manipulations were performed using standard Schlenk techniques under dry argon in flame-dried glassware. Anhydrous solvents were distilled from appropriate drying agents and were transferred under Argon: THF, $\mathrm{Et}_{2} \mathrm{O}(\mathrm{Mg} /$ anthracene $), \mathrm{CH}_{2} \mathrm{Cl}_{2}\left(\mathrm{CaH}_{2}\right), \mathrm{CH}_{3} \mathrm{CN}\left(\mathrm{CaH}_{2}\right)$, hexane, toluene $(\mathrm{Na} / \mathrm{K})$, $\mathrm{EtOH}, \mathrm{MeOH}(\mathrm{Mg}), \mathrm{Et}_{3} \mathrm{~N}(\mathrm{MS}), \mathrm{DMF}(\mathrm{MS}) . \mathrm{Ni}(\mathrm{acac})_{2}$ purchased from Alpha Aesar, azeotropically distilled from toluene to remove traces of water, and stored in a 2 neck-flask under argon. Small amounts were kept in a Teflon sealed vial, handled open to air, and placed under argon between uses. Fresh $\mathrm{Ni}(\mathrm{acac})_{2}$ was used to replaced aged samples approximately every 3 weeks. Commercially available Grignard reagents were obtained from Sigma Aldrich. Flash chromatography: Merck silica gel $60(40-63 \mu \mathrm{~m})$. GC-MS (FID): GC-MS-QP2010 equipped (Shimadzu Europe Analytical Instriuments). MS (EI): Finnigan MAT 8200 (70 eV), ESI-MS: ESQ 3000 (Bruker). Accurate mass determinations: Bruker APEX III FT-MS (7 T magnet) or MAT 95 (Finnigan). NMR spectra were recorded using a Bruker Avance VIII-300, Bruker Avance III HD 400 MHz spectrometer, Bruker Avance III 500 MHz spectrometer equipped with a 5 mm BBFO probe. ${ }^{1} \mathrm{H}$ NMR spectra $(300.13 \mathrm{MHz}$, 400.1 MHz , or 500 MHz ) were referenced to the residual protons of the deuterated solvent used. ${ }^{13} \mathrm{C}\{1 \mathrm{H}\}$ NMR spectra ( 75.47 MHz .101 MHz , or 125 MHz ) were referenced internally to the D-coupled ${ }^{13} \mathrm{C}$ resonances of the NMR solvent. All compounds purified by column chromatography are shown with the isomerized product in the same spectra, and the obtained selectivities were determined by the integration of the respective terminal methyl groups. Chemical shifts ( $\delta$ ) are given in ppm, relative to deuterated solvent residual peak, and coupling constants (J) are provided in Hz .

## 3. Synthesis of Ligands

## Preparation of Mesylate

To a mixture of the respective diol ( $22 \mathrm{mmol}, 1 \mathrm{eq}$.$) , DMAP ( 0.33 \mathrm{mmol}, 40 \mathrm{mg}, 0.015 \mathrm{eq}.), \mathrm{DCM}(10 \mathrm{~mL})$ and pyridine ( 20 mL ), was added methanesulfonylchloride ( $86.7 \mathrm{mmol}, 6.7 \mathrm{~mL}, 4 \mathrm{eq}$. ) at $0{ }^{\circ} \mathrm{C}$. The resulting suspension was stirred for 4 h at the same temperature. Subsequently, the reaction mixture was poured onto icecold $\mathrm{HCl}(2 \mathrm{M}, 100 \mathrm{~mL})$, and extracted with $\mathrm{DCM}(3 \times 30 \mathrm{~mL})$. The combined organic layers were washed with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ and with saturated aq $\mathrm{NaHCO}_{3}$ solution ( 50 mL ), dried over $\mathrm{MgSO}_{4}$, concentrated, and purified by column chromatography (Hexanes/EtOAc).

## Preparation of Diphosphines ${ }^{9}$

While rigorously stirring, $\mathrm{n}-\mathrm{BuLi}(13 \mathrm{~mL}, 1.6 \mathrm{M}, 3 \mathrm{eq}$.$) was added dropwise to a solution of$ diphenylphosphine ( $3 \mathrm{~mL}, 17.3 \mathrm{mmol}, 2.5 \mathrm{eq}$.) in THF ( 40 mL ) at $0^{\circ} \mathrm{C}$. The deep-red solution was allowed to stir for 1 h at $25^{\circ} \mathrm{C}$. Subsequently, a solution prepared from the respective dimesylate ( $7 \mathrm{mmol}, 1 \mathrm{eq}$.) in THF ( 20 mL ) was slowly added and stirred for an additional 4 h at the same temperature. The reaction was quenched with MeOH . The mixture was concentrated in vacuo and the crude product was partitioned between $\mathrm{Et}_{2} \mathrm{O}$ (60 mL ) and saturated aq $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 32 mL ). The aq phase was extracted under inert atmosphere with $\mathrm{Et}_{2} \mathrm{O}$ (2 $\times 30 \mathrm{~mL}$ ). The combined organic phases were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and quickly filtered through a short plug of silica. The solution was concentrated and the product recrystallized.

## 4. Optimization Studies

General Procedure for Early Optimization
A culture tube equipped with a stir bar was charged with $\mathrm{Ni}(\mathrm{acac})_{2}(2.6 \mathrm{mg}, 0.01 \mathrm{mmol})$ and phosphine ligand ( 0.01 mmol ). A teflon cap was fitted, and the tube was evacuated for 15 min , refilled with argon, and then the atmosphere was recycled 2 times. 4-Fluoroanisole ( 0.2 mmol ) was added, followed by toluene, ensuring to rinse any residual substrate from the walls of the vial. The mixture was vigorously stirred, and the Grignard nucleophile ( $0.2-0.4 \mathrm{mmol}$ ) was added with a single push of the syringe. The reaction was then stirred at the desired temperature for 24 h . The solution was diluted with MTBE ( $\sim 10 \mathrm{~mL}$ ) and quenched with saturated aq $\mathrm{NH}_{4} \mathrm{Cl}$ or $\mathrm{H}_{2} \mathrm{O}(1 \mathrm{~mL})$. Tetradecane was added as an internal standard, and GC was used to confirm the branched/linear selectivity and yield.
*Moisture sensitive additives were added in an argon-filled glovebox before adding fluoroanisole.

## 5. General Procedure

A culture tube equipped with a stir bar was charged with $\mathrm{Ni}(\mathrm{acac})_{2}(2.6 \mathrm{mg}, 0.01 \mathrm{mmol})$ and phosphine ligand $\mathbf{L 4}(4.7 \mathrm{mg}, 0.01 \mathrm{mmol})$, and additionally aryl fluoride if solid. A teflon cap was fitted, and the tube was evacuated and refilled with argon (3 cycles). The tube was transferred to a glove box, and anhydrous CsF (6.0 $\mathrm{mg}, 0.04 \mathrm{mmol}$ ) was added. The tube was removed from the glove box, and placed under a positive pressure of argon. Aryl fluoride ( 0.2 mmol ) was added (if liquid), followed by toluene ( 1 mL ), ensuring to rinse any residual aryl fluoride from the walls of the vial. The mixture was vigorously stirred, and the Grignard nucleophile (100-200 $\mu \mathrm{L}, 0.2 \mathrm{M}, 0.2-0.4 \mathrm{mmol}$ ) was added with a single push of the syringe. The reaction was then stirred at the desired temperature $\left(0^{\circ} \mathrm{C}\right.$ to $\left.60^{\circ} \mathrm{C}\right)$ until the reaction was judged complete by TLC or GC. The solution was diluted with EtOAc or MTBE ( $\sim 10 \mathrm{~mL}$ ) and quenched with saturated aq $\mathrm{NH}_{4} \mathrm{Cl}$ or $\mathrm{H}_{2} \mathrm{O}$ (3 mL ) - depending on substrate sensitivity to acid. The aq phase was separated and extracted with MTBE (3 x 5 mL ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated in vacuo. The desired product was then purified by flash chromatography with a mixture of pentane/EtOAc, pentane/MTBE, or $\mathrm{DCM} / \mathrm{MeOH}$ to afford the desired coupled product.

## 7. Additional Results/Observations

## Example Unsuccessful Substrates

Some substrates did not afford alkylated product under our catalytic protocol or proved recalcitrant to facile purification. For example, 4-fluorostyrene failed to show any conversion from the starting material. Molecules with functionality at the benzylic position also proved incompatible, and did not provide an indication of reactivity. Primary amines were also problematic, and no product was detected.

Grignard reagents prepared with solutions of THF were also found to perform poorly, and THF employed as solvent was found to preclude observable reaction progress. We propose that this detrimental effect arises through formation of an adduct with the Grignard, but thus far, only speculation has been put forth.

## Additional Experiments and Considerations

After optimization, control reactions showed the requirement of the nickel catalyst and ligand to obtain couple product. Furthermore, control experiments for all electron deficient compounds that might experience competing $S_{N} A r$ pathways of the Grignard without participation of the catalyst were completed. In each case, no product was observed when the catalyst was excluded.

An attempt to expand the scope to tertiary nucleophiles led to rearrangement of the nucleophile $t-\mathrm{BuMgCl}$, with several distinct isomers identified by GC. Therefore, further attempts to expand beyond $t$ - BuMgCl were not explored. Experiments utilizing chiral nucleophiles were not attempted for utilization herein.

While Grignard nucleophiles were consistently added in a single push, the relevance of an exotherm does not seem to strongly influence the reaction. This is demonstrated by compound $\mathbf{3 0}$, as the scale up had only a slight influence on the reaction outcome, despite the expected distinct exotherm profiles.

## 8. X-ray Crystallography Data

## General Procedure

To obtain crystals suitable for X-ray study, $\mathrm{NiCl} 2.6 \mathrm{H}_{2} \mathrm{O}(63.3 \mathrm{mg}, 0.121 \mathrm{mmol})$ was dissolved in EtOH (1 $\mathrm{mL})$. A solution of phosphine ligand $(0.121 \mathrm{mmol})$ in $\mathrm{DCM}(0.8 \mathrm{~mL})$ was added to the solution. The resulting red/orange solid was washed with $\mathrm{Et}_{2} \mathrm{O}(3 \times 1 \mathrm{~mL})$. The solid was then dried in vacuo. Afterwards, the solid was dissolved in DCM ( 24 mL ) and layered with $\mathrm{Et}_{2} \mathrm{O}$ to obtain crystals. X-ray analysis was subsequently completed.
