## Chemical synthesis of AdoMet analogs

## Preparation of aminoalcohols

$\mathrm{n}=1,4$-Aminobut-2-yn-1-ol hydrochloride, 14
$\mathrm{n}=3,6$-Aminohex-2-yn-1-ol hydrochloride, 15

A solution ( 150 ml ) of 4-phthalimidobut-2-yn-1-ol $(7.6 \mathrm{~g}, 35 \mathrm{mmol}$, 1 equiv, prepared from 2-butyn-1,4-diol according to Thomson methodology) ${ }^{1}$ or 6-phthalimidohex-2-yn-1-ol ( $8.5 \mathrm{~g}, 35 \mathrm{mmol}$, 1 equiv, prepared from 5-chloro-1-pentyne according to adapted methodologies) ${ }^{2}$ in methanol was treated with hydrazine hydrate $(3.46 \mathrm{ml}, 70 \mathrm{mmol}, 2$ equiv). The reaction mixture was heated with reflux for 2 h and after cooling to room temperature the solvent was removed under reduced pressure ( $100 \mathrm{mmHg}, 40^{\circ} \mathrm{C}$ ). Water and ethanol ( $100 \mathrm{ml}, 1: 1 \mathrm{mixture}$ ) and conc. hydrochloric acid ( 100 ml ) were added to the residue. The mixture was heated with reflux for 20 min and the precipitate removed by filtration. The filtrate was concentrated under reduced pressure $\left(10 \mathrm{mmHg}, 60^{\circ} \mathrm{C}\right)$. The resulting 4-aminobut-2-yn-1-ol hydrochloride residue was crystallized from methanol as a white solid. The 6-aminohex-2-yn-1-ol was used in further reactions without crystallization.
4-Aminobut-2-yn-1-ol hydrochloride (14), yield $82 \%$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}, \delta$ ): 3.77 ( $\mathrm{t}, J=2.0$ $\mathrm{Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}$ ), $4.18\left(\mathrm{t}, J=2.0,-\mathrm{CH}_{2}-, 2 \mathrm{H}\right) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}, \delta$ ): 32.09, 52.23, 79.15, 87.96.
6-Aminohex-2-yn-1-ol hydrochloride (15), yield $70 \%{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}, \delta$ ): 1.80-1.90 (m, -$\mathrm{CH}_{2^{-}}, 2 \mathrm{H}$ ), 2.39 (tt, $J=7.0,2.2 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}$ ), 3.13 (t, $J=7.0 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}$ ), $4.22(\mathrm{t}, J=2.2 \mathrm{~Hz},-$ $\mathrm{CH}_{2}-, 2 \mathrm{H}$ ); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}, \delta$ ): $15.49,25.78,38.80,49.91,79.58,84.62 . \mathrm{HRMS}: \mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]^{+}$ calcd for $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{NO}$ : 114.0913; found: 114.0914

## Preparation of octa-2,7-diyn-1-ol (16)

To a cooled solution $\left(-80{ }^{\circ} \mathrm{C}\right)$ of the hepta-1,6-diyne ( $2 \mathrm{~g}, 25.6 \mathrm{mmol}$, 1 equiv) in 30 ml THF butyllithium solution in hexanes ( $3 \mathrm{ml}, 30 \mathrm{mmol}, 1.2$ equiv) was added (modified method described in ${ }^{3}$ ). Mixture was stirred for 1 h and paraformaldehyde powder ( $0.85 \mathrm{~g}, 25.6 \mathrm{mmol}, 1$ equiv) was added in one portion. The stirring mixture was allowed to warm to room temperature over $\sim 4 \mathrm{hr}$. The suspension of paraformaldehyde gradually dissolved during this period. The reaction was quenched by addition of 50 ml of ice-cold water. The aqueous layer was separated and extracted with three 50 ml portions of diethyl ether. Combined organic layers were dried over anhydrous magnesium sulfate and evaporated. Product was purified via flash chromatography (silica gel flushed with chloroforme, target product eluted with ethyl acetate step gradient). Two separately eluting fraction were collected which
gave clear oil. NMR spectra confirmed that one fraction is octa-2,7-diyn-1-ol ( $0.8 \mathrm{~g}, 7.4 \mathrm{mmol}, 29 \%$ yield) and the other - nona-2,7-diyne-1,9-diol ( $0.67 \mathrm{~g}, 4.9 \mathrm{mmol}, 19 \%$ yield $)$.
Octa-2,7-diyn-1-ol (16), 29\% yield. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 1.63-1.75 (m, - $\mathrm{CH}_{2}-, 2 \mathrm{H}$ ), 1.94 (t, $J=2.6 \mathrm{~Hz}, \equiv \mathrm{CH}, 1 \mathrm{H}), 2.09(\mathrm{br} \mathrm{s},-\mathrm{OH}, 1 \mathrm{H}), 2.30\left(\mathrm{~m},-\mathrm{CH}_{2}-, 4 \mathrm{H}\right), 4.21\left(\mathrm{t}, J=2.2 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $17.99,24.80,26.61,51.24,51.46,79.34,83.73,85.35$.

Preparation of 6-azidohex-2-yn-1-ol (17)

To a solution of the 6 -chlorohex-2-yn-1-ol ( $0.1 \mathrm{~g}, 0.74 \mathrm{mmol}, 1$ equiv) in 5 ml DMF sodium azide $(0.147 \mathrm{~g}, 2.26 \mathrm{mmol}, 3$ equiv) and tetrabutylammonium bromide ( $0.024 \mathrm{~g}, 0.074 \mathrm{mmol}, 0.1$ equiv) were added. The mixture was stirred for 24 h at $80^{\circ} \mathrm{C}$ (sand bath) temperature, then 5 ml of water was added to reaction vessel. Target product was extracted with diethyl ether ( $3 \times 10 \mathrm{ml}$ ), combined organic layers were dried over magnesium sulphate and evaporated. Purification of product via flash chromatography (silica gel $5-40 \mu \mathrm{~m}$, flushed with benzene, target product eluted with dichloromethane) afforded clear oil after removal of eluent under reduced pressure.
6-Azidohex-2-yn-1-ol (17), 70\% yield. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 1.81 ( $\mathrm{m},-\mathrm{CH}_{2}$ - and $-\mathrm{OH}, 3 \mathrm{H}$ ), 2.37 (tt, $\left.J=6.9,2.4 \mathrm{~Hz},-\mathrm{C} \equiv \mathrm{CCH}_{2^{-}}, 2 \mathrm{H}\right), 3.44\left(\mathrm{t}, J=6.9 \mathrm{~Hz},-\mathrm{CH}_{2^{-}}, 2 \mathrm{H}\right), 4.28\left(\mathrm{t}, J=2.4 \mathrm{~Hz},-\mathrm{CH}_{2^{-}}\right.$, $2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 16.3, 27.9, 50.0, 51.5, 79.6, 84.7; IR: $v\left(\mathrm{~cm}^{-1}\right)=3350(\mathrm{OH}), 2223$ $(\mathrm{C} \equiv \mathrm{C}), 2100\left(\mathrm{~N}_{3}\right)$.

## Protection of reactive amino group

$\mathrm{n}=1,4$-( $N$-Boc-amino)but-2-yn-1-ol, 18 $\mathrm{n}=3,6$-( $N$-Boc-amino)hex-2-yn-1-ol, 19

Protection of a primary amino group in aminoalcohols was performed according to published procedures. ${ }^{4}$
4-(N-Boc-amino)but-2-yn-1-ol (18), yield $90 \% .^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $1.45\left(\mathrm{~s},-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right.$, $9 \mathrm{H}), 3.95\left(\mathrm{~s},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 4.26\left(\mathrm{~s},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right) ; 5.08(\mathrm{br} \mathrm{s},-\mathrm{NH}-, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $28.25,30.50,50.62,80.08,81.39,81.55,155.58$.
6-(N-Boc-amino)hex-2-yn-1-ol (19), yield $80 \%$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $1.35\left(\mathrm{~s},-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right.$, 9 H ); 1.56-1.65 (m, -CH $2_{2}-2 \mathrm{H}$ ), 2.18 ( $\mathrm{tt}, J=6.9,2.0 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}$ ), $3.08-3.18\left(\mathrm{~m},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 3.48$ (br $\mathrm{s},-\mathrm{OH}, 1 \mathrm{H}$ ), $4.14\left(\mathrm{br} \mathrm{s},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 4.90(\mathrm{br} \mathrm{s},-\mathrm{NH}-, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 16.39 , $28.65,28.86,39.76,51.05,79.56,79.82,84.89,156.46$. HRMS: $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{11} \mathrm{H}_{19} \mathrm{NO}_{3}$ : 236.1257; found: 236.1276 .

$\mathrm{n}=1,4-[4-(N$-Boc-amino)butanamido]but-2-yn-1-ol, 20
$\mathrm{n}=3,6-[4-(N$-Boc-amino)butanamido]hex-2-yn-1-ol, 21

4 -( $N$-Boc-amino)butanoic acid ( $2 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv, prepared in analogy to ${ }^{4}$ ) was dissolved in anhydrous tetrahydrofuran ( 20 ml ), carbonyldiimidazole (CDI) ( $1.8 \mathrm{~g}, 11 \mathrm{mmol}, 1.1$ equiv) was added, and the resulting clear solution was stirred at room temperature for 2 H . Then, the aminoalcohol ( 1.2 g 4 -aminobut-2-yn-1-ol hydrochloride or 1.5 g 6 -aminohex-2-yn-1-ol hydrochloride, $10 \mathrm{mmol}, 1$ equiv) and triethylamine $(2.8 \mathrm{ml}, 20 \mathrm{mmol}, 2$ equiv) were added and stirring was continued at room temperature for 2 h . The solvent was removed under reduced pressure ( $50 \mathrm{mmHg}, 40^{\circ} \mathrm{C}$ ) and the crude product was purified by column chromatography (silica gel, 40 g , chloroform/ethylacetate 1:1). Product containing fractions were pooled and solvent was removed under reduced pressure.
4-[(4-N-Boc-amino)butanamido]but-2-yn-1-ol (20), yield $52 \% .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 1.41 $\left(\mathrm{s},-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}, 9 \mathrm{H}\right), 1.74-1.83\left(\mathrm{~m},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 2.22\left(\mathrm{t}, J=7.1 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H},\right), 3.09-3.18\left(\mathrm{~m},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right)$, 4.03-4.09 (m, $\left.-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 4.09-4.14\left(\mathrm{~m},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 4.84(\mathrm{br} \mathrm{s}, 1 \mathrm{H},-\mathrm{NH}-), 6.67(\mathrm{br} \mathrm{s}, 1 \mathrm{H},-\mathrm{NH}-) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 26.38, 28.64, 29.62, 33.52, 40.05, 50.74, 79.63, 81.22, 81.86, 153.87, 171.53.

6-[(4-N-Boc-amino)butanamido]hex-2-yn-1-ol (21), yield $60 \%$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 1.45 $\left(\mathrm{s},-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}, 9 \mathrm{H}\right), 1.69-1.87\left(\mathrm{~m},-\mathrm{CH}_{2^{-}}, 4 \mathrm{H}\right), 3.16\left(\mathrm{t}, J=6.5 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 3.39\left(\mathrm{q}, J=6.5,-\mathrm{CH}_{2^{-}}\right.$, $2 \mathrm{H}), 4.24\left(\mathrm{t}, J=2.2 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 5.06(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 6.81(\mathrm{br} \mathrm{s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta\right)$ : $16.74,26.65,28.21,28.66,33.89,39.01,40.14,51.12,79.73,80.08,84.99,159.93,173.41$.

Activation of alcohols by sulfonylation

$\mathrm{X}=-\mathrm{CH}_{2}-, 4$-( N -Boc-amino)but-2-ynyl 4-nitrobenzenesulfonate, 24
$\mathrm{X}=-\left(\mathrm{CH}_{2}\right)_{3^{-}}, 6-(\mathrm{N}$-Boc-amino)hex-2-ynyl 4-nitrobenzenesulfonate, $\mathbf{2 5}$
$\mathrm{X}=-\mathrm{CH}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})-\left(\mathrm{CH}_{2}\right)_{3^{-}}, 4-[(4-\mathrm{N}$-Boc-amino)butanamido]but-2-yn-1-yl 4-nitrobenzenesulfonate, 26
$\mathrm{X}=-\left(\mathrm{CH}_{2}\right) 3-\mathrm{NH}-\mathrm{C}(\mathrm{O})-\left(\mathrm{CH}_{2}\right)_{3^{-}}, 6-[(4-\mathrm{N}$-Boc-amino)butanamido]hex-2-yn-1-yl 4-nitrobenzenesulfonate, 27

Octa-2,7-diynyl 4-nitrobenzenesulfonate, 28
An but-2-yn-1-ol (22) and pent-2-yn-1-ol triflates (23) were prepared according to ${ }^{5,6}$ and used for the AdoHcy alkylation without purification.
The 4-nitrobenzenesulfonyl addition was performed following amodified previously described procedure. ${ }^{7}$ 4-Nitrobenzenesulfonyl chloride ( $0.90 \mathrm{~g}, 4 \mathrm{mmol}, 1.1$ equiv) and sodium hydroxide ( 0.74 $\mathrm{g}, 18.5 \mathrm{mmol}, 5$ equiv) were added to a solution of protected aminoalcohol ( $3.6 \mathrm{mmol}, 1$ equiv) in methylene chloride ( 15 ml ) at $0^{\circ} \mathrm{C}$. After stirring the reaction mixture for 3 h at room temperature sodium hydroxide was filtered, the reaction was quenched with 20 ml of cold water, extracted with methylene chloride ( $3 \times 10 \mathrm{ml}$ ) and the combined organic layers dried over sodium sulfate. The sample was passed through a glass filter and concentrated under reduced pressure ( $200 \mathrm{mmHg}, 30^{\circ} \mathrm{C}$ ) as a slightly yellow solid.
But-2-yn-1-ol triflate (22). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $1.93\left(\mathrm{t}, J=2.5 \mathrm{~Hz},-\mathrm{CH}_{3}, 3 \mathrm{H}\right.$ ), 5.07 (t, $J=2.5 \mathrm{~Hz},,-\mathrm{CH}_{2} \mathrm{O}-, 2 \mathrm{H}$ ), ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 3.7, $65.2,69.8,89.6,118.7(\mathrm{q}, J(\mathrm{CF})=318$ $\mathrm{Hz} ;-\mathrm{CF}_{3}$ ),
4-( $\boldsymbol{N}$-Boc-amino)but-2-ynyl 4-nitrobenzenesulfonate (24), yield $45 \%$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ס): $1.47\left(\mathrm{~s},-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}, 9 \mathrm{H}\right), 3.84\left(\mathrm{~s},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 4.61(\mathrm{br} \mathrm{s},-\mathrm{NH}-, 1 \mathrm{H}), 4.87\left(\mathrm{~s},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right) ; 8.09-8.26$ (m, Ar H, 2H), 8.38-8.53 (m, Ar H, 2H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 28.55, 30.57, 59.34, 74.28, 80.71, 87.32, 124.67, 129.72, 142.36, 151.18, 171.87.

6-(N-Boc-amino)hex-2-ynyl 4-nitrobenzenesulfonate (25), yield $27 \%$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$, $\delta): 1.41\left(\mathrm{~s},-\mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}, 9 \mathrm{H}\right) ; 1.49-1.58\left(\mathrm{~m},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 2.09\left(\mathrm{tt}, J=7.0,2.2 \mathrm{~Hz},-\mathrm{CH}_{2^{-}}, 2 \mathrm{H}\right), 3.03-3.10(\mathrm{~m}$,

Octa-2,7-diynyl 4-nitrobenzenesulfonate (28), yield $51 \%$. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 1.54 (m, -$\left.\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 1.95(\mathrm{t}, J=2.6 \mathrm{~Hz}, \equiv \mathrm{CH}, 1 \mathrm{H}), 2.15\left(\mathrm{~m},-\mathrm{CH}_{2}-, 4 \mathrm{H}\right), 4.83\left(\mathrm{t}, J=2.2 \mathrm{~Hz},-\mathrm{CH}_{2}-, 2 \mathrm{H}\right), 8.10-$ 8.15 (m, Ar H, 2H), 8.36-8.42 (m, Ar H, 2H). ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 17.78, 27.04, 34.65, $60.13,69.59,72.34,83.06,90.68,124.61,129.71,142.71,151.04$.

## Preparation of 6-azidohex-2-ynyl-4-nitrobenzenesulfonate

6-Azidohex-2-ynyl 4-nitrobenzenesulfonate, 29

To cooled $\left(0^{\circ} \mathrm{C}\right)$ solution of 6 -azidohex-2-yn-1-ol (14) ( $0.073 \mathrm{~g}, 0.52 \mathrm{mmol}, 1$ equiv) in anhydrous THF ( 5 ml ) potassium tert-butoxide ( $0.055 \mathrm{~g}, 0.49 \mathrm{mmol}, 0.9$ equiv) was added, after several minutes to clear solution a 4-nitrobenzenesulfonyl chloride ( $0.110 \mathrm{~g}, 0.49 \mathrm{mmol}, 0.9$ equiv) was added. Reaction mixture was stirred for 2 h , then solvent was evaporated under reduced pressure, and residue purified via flash chromatography (silica gel 5-40 $\mu \mathrm{m}$, flushed with benzene, target product eluted with dichloromethane). Removal of eluent afforded target product as yellowish powder (m.p. 37-38 ${ }^{\circ} \mathrm{C}$ ).

$$

An activated alcohol (100-200 equivalents of triflate, prepared according to (Ross et al., 2000), or 1030 equivalents of 4-nitrobenzenesulfonyl ester, or 6 equivalents 6-Azidohex-2-ynyl-4-nitrobenzenesulfonate (see above)) was slowly added to $S$-adenosyl-L-homocysteine (AdoHcy, 10, $10-30 \mathrm{mg}, 1$ equiv) in a $1: 1$ mixture of formic acid and acetic acid $(0.5-1.0 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$. The solutions were allowed to warm up to room temperature and incubated with shaking. After specified times (2-24 h) the reactions were quenched by adding water ( $5-10 \mathrm{ml}$ ). The aqueous phase was extracted three times with equal volume of diethyl ether and water was removed in rotary evaporator ( $10 \mathrm{mmHg}, 30^{\circ} \mathrm{C}$ ). Residue was dissolved in 10 ml of HPLC buffer. Purification of cofactors $\mathbf{2}$ and $\mathbf{3}$ was performed by preparative reversed-phase HPLC. The 4-nitrobenzenesulfonate was removed by passing solution through Dowex 1 anion exchanger column prior the HPLC purification.
Deprotection of amino group was performed by adding two volumes of $\mathrm{CF}_{3} \mathrm{COOH}$ to the water solution of AdoMet analogue and incubating for 1 h at room temperature. This procedure completely removes Boc protecting group since no protected cofactor peak appeared after such treatment.

## Purification of AdoMet analogs

Purification of AdoMet analogs was performed by preparative reversed-phase HPLC (Supelco Discovery C18 $10 \times 250,5 \mu \mathrm{~m}$ or Supelco Discovery HS C18 $10 \times 150,5 \mu \mathrm{~m}$ ) eluting with a linear gradient of solvents A ( $20 \mathrm{mM} \mathrm{HCOONH} 44, \mathrm{pH} 3.5$ ) and $\mathrm{B}(80 \%$ methanol solution in water) at a flow rate of $4.5 \mathrm{ml} / \mathrm{min}$. The diastereomers of cofactors $\mathbf{8}$ and 9 were separated using preparative reversedphase HPLC (column - Agilent Prep-C18, dimensions: $30 \times 150,10 \mu \mathrm{~m}$, PN 413910-302) eluting at a flow rate of $33 \mathrm{ml} / \mathrm{min}$ using $20 \mathrm{mmol} / \mathrm{L}$ ammonium formate buffer ( $\mathrm{pH}=3.5$ ) as eluent A and $60 \%$ methanol in water as eluent B. Compounds were detected by their absorption at 260 and 280 nm . Enriched Fractions were pooled, lyophilized under reduced pressure in a rotary evaporator ( 10 mmHg , $30^{\circ} \mathrm{C}$ ) and desalted by passing through reverse phase C-18 silica gel. Structure of novel compound was confirmed by NMR measurements and yields determined by UV absorption of the adenine chromophore ( $\varepsilon_{260}=154001 \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$ ).

## Supplementary Figures

Figure S1. Decomposition kinetics of cofactors 1-9 in M.HhaI buffer ( 50 mM Tris-HCl, pH 7.4, 0.5 mM EDTA, 2 mM 2-mercaptoethanol, $10 \mathrm{mM} \mathrm{NaCl}, 0.2 \mathrm{mg} / \mathrm{ml} \mathrm{BSA}$ ) at $37^{\circ} \mathrm{C}$.

Figure S2. Decomposition timecourse of cofactor 3 in M.HhaI buffer ( 50 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.4,0.5$ mM EDTA, 2 mM 2-mercaptoethanol, $10 \mathrm{mM} \mathrm{NaCl}, 0.2 \mathrm{mg} / \mathrm{ml} \mathrm{BSA}$ ) at $37^{\circ} \mathrm{C}$ as monitored by HPLC. Reaction products were identified by UV spectra and mass spectrometry.

A

B

C

Figure S3. ESI-MS analysis of hydration products observed with Cofactor 5. (A) Addition of water to the cofactor 5 (theoretical mass 537.2238) leads to a product of (555.2344); (B) MS/MS fragmentation spectra of precursor ions (marked with diamonds) for cofactor 5 (left panel) and its hydration product (right panel); (C) Fragmentation pathways and experimentally observed products (theoretical masses shown in boldface) indicate that the hydration occurs to the side chain R of the cofactor.

Figure S4. Kinetics of cofactor $\mathbf{5}$ decomposition at different pH .

Figure S5. Evaluation of the utility of AdoMet analogs in transalkylation reactions using DNA protection assays. An engineered variant of M.HhaI as indicated was incubated with lambda DNA and cofactor $(300 \mu \mathrm{M})$ at $37{ }^{\circ} \mathrm{C}$ for 1 h at a series of dilutions (molar ratios of MTase to its target sites are as indicated). Modified DNA was treated with R.Hin6I endonuclease and analyzed by agarose gel electrophoresis. Two upper left panels indicate experiments in which either the cofactor $\mathbf{4}$ or the MTase was added first in the reaction mixture indicating poor reproducibility of the reaction due to an extremely fast decay of the cofactor. Control reactions: K1 - no MTase, K2 - no cofactor, K3 - no MTase, no cofactor, K4 - untreated DNA. Lanes representing highest MTase dilutions that render full protection of target sites in DNA are marked with arrows. Full protection of substrate DNA from endonuclease cleavage in reaction in which a MTase is present in an $N$-fold dilution relative to its target sites indicates that the enzyme carried out at least $N$ turnovers; the turnover rate was calculated by dividing the number of turnovers by reaction time $t\left(k_{\mathrm{obs}} \geq N / t\right)$

Figure S6. HPLC-MS analysis of mTAG transalkylation products formed in duplex oligodeoxynucleotides with cofactors $1-4$ and 6-9 and eM.HhaI. (A) Nucleoside HPLC UV traces of enzymatically fragmented duplex oligodeoxynucleotide obtained after modification with eM.HhaI in the presence of AdoMet analogs. (B) ESI-MS analysis of HPLC fractions corresponding to modified nucleosides. N denotes 2'-deoxynucleoside; B - nucleobase.
*Reaction product of cofactor 4 co-elutes with and its UV signal is fully obscured by dC (trace not shown), but is identified by MS.

Figure S7. Sequence-specific click-labeling of DNA using eM.HhaI and cofactors $\mathbf{8}$ and $\mathbf{9}$ in mixtures with 1 (AdoMet) in vitro. Plasmid $\mathrm{p} \Delta \mathrm{GH}_{6} \mathrm{E} 119 \mathrm{H}$ DNA ( $0.25 \mu \mathrm{M}$ targets) was modified with eM.HhaI $(0.125 \mu \mathrm{M})$ in the presence of cofactor $\mathbf{1}$ and synthetic cofactor $\mathbf{8}$ or $\mathbf{9}$ combined in different ratios as indicated (total cofactor concentration $50 \mu \mathrm{M}$ ). Control sample (lanes C) contained no cofactor. Modified DNA was labeled with a suitable dye and then treated with R.HincII and R.PscI endonucleases to give three DNA fragments containing 9, 5 or 0 HhaI target sites. The resulting fragments were separated on an agarose gel and scanned for labeling dye and EtBr fluorescence. $\mathrm{M}-1$ kb DNA Ladder, Fermentas.
(A) mTAG labeling with cofactor 8 and Alexa647 azide. Modified DNA was analyzed by agarose gel electrophoresis then stained with ethidium bromide and scanned for Alexa647 ( 635 nm laser) and EtBr (473 nm laser) fluorescence; (B) mTAG labeling with cofactor 9 and Alkyne MegaStokes608 dye. The gel was first scanned for MegaStokes fluorescence ( 473 nm laser), then stained with ethidium bromide and scanned again to visualize bulk DNA.

Figure S8. Methylation and modification in crude cell lysate. E.coli ER2267 cells carrying the $\mathrm{p} \Delta \mathrm{GH}_{6} \mathrm{E} 119 \mathrm{H}$ plasmid were lysed with lysozyme and the lyzate was complemented with eM.HhaI (2 $\mu \mathrm{M})$ and cofactor $\mathbf{1}$ (control) or $\mathbf{9}(50 \mu \mathrm{M})$. After modification the plasmids were purified from the lysate and aliquots digested with the R.Hin6I (lanes H), or McrBC (lanes M) nuclease. R.Hin6I cleaves DNA at unmodified HhaI target sites (lanes 2 and 11), but does not cleave at modified sites (lanes 5 and 8); McrBC fragments DNA in the vicinity of methylated HhaI targets (lane 6); both nucleases are inactive on GCGC sites modified with extended alkyl groups. ${ }^{9}$ Lane 13 - GeneRuler DNA Ladder mix, Fermentas. Resistance of DNA modified with eM.HhaI and cofactor 9 to the action of both nucleases (lanes 8 and 9 ) indicates its complete alkylation of the GCGC sites.
