${ }^{a}$ The terminology is chosen such that $X_{0}$ is decomposed as follows: $X_{0}=X_{\mathrm{e}}+\Delta X_{\text {vib }}+\Delta X_{\text {el }}$, with $X_{\mathrm{e}}$ denoting the equilibrium rotational constant. $\Delta X_{\text {vib }}$ and $\Delta X_{\mathrm{el}}$ are defined as in ref 74 of the main paper.
${ }^{b}$ The $\Delta X_{\text {vib }}$ values were computed at the level of UHF-CCSD $(T) / A V Q Z$ for $\mathrm{PH}_{2}, \mathrm{PD}_{2}$, and $\mathrm{PF}_{2}, \operatorname{CCSD}(\mathrm{~T}) / \mathrm{AVQZ}$ for $\mathrm{PCl}_{3}, \operatorname{CCSD}(\mathrm{~T}) / \mathrm{VQZ}$ for $\mathrm{PF}_{5}$ and $\mathrm{PCl}_{3} \mathrm{~F}_{2}$, and $\operatorname{CCSD}(\mathrm{T}) / \mathrm{VTZ}$ for $\mathrm{PCl}_{5}$ at the associated optimized equilibrium geometries (see Tables 3-5 of the main paper; the UHF-CCSD $(\mathrm{T}) / \mathrm{AVQZ}$ geometries of $\mathrm{PH}_{2}$ and $\mathrm{PF}_{2}$ are as follows: $r_{\mathrm{e}}(\mathrm{PH})=141.90 \mathrm{pm}$, $\left.\theta_{\mathrm{e}}(\mathrm{HPH})=91.884^{\circ} ; r_{\mathrm{e}}(\mathrm{PF})=158.24 \mathrm{pm}, \theta_{\mathrm{e}}(\mathrm{FPF})=98.243^{\circ}\right)$. The $g$ factors as well as $\Delta X_{\mathrm{el}}$ were always calculated at the $\operatorname{CCSD}(\mathrm{T}) /$ AWCVTZ level at the corresponding best estimated equilibrium geometries (see Tables 3-5 of the main paper). Due to program limitations, the $g$ factors could not be calculated for the open-shell species $\left(\mathrm{PH}_{2}, \mathrm{PD}_{2}, \mathrm{PF}_{2}\right)$.
${ }^{c}$ In addition, $g_{\mathrm{aa}}=-0.02637$ and $\Delta A_{\text {el }}=-0.0377 \mathrm{MHz}$, respectively.
${ }^{d}$ The entry refers to $g_{\text {aa }}$ and $\Delta A_{\text {el }}$, respectively, due to the fact that $\mathrm{PF}_{5}, \mathrm{P}^{35} \mathrm{Cl}_{5}$, and $\mathrm{P}^{37} \mathrm{Cl}_{5}$ are prolate tops.

Table S2. Computed Vibrational Contributions $\Delta X_{\text {vib }}\left(X=B, C ; 10^{-2} \mathbf{c m}^{-1}\right)$ to the Ground-State Rotational Constants $X_{0}$, Rotational $g$ Tensors (Dimensionless), and Electronic Contributions $\Delta X_{\mathrm{el}}\left(10^{-5} \mathbf{c m}^{-1}\right)$ to $X_{0}$ of Selected Symmetric Top Molecules ${ }^{a, b, c}$

| Molecule | $\Delta B_{\text {vib }}$ | $\Delta C_{\text {vib }}$ | $g_{\mathrm{bb}}$ | $g_{\mathrm{cc}}$ | $\Delta B_{\mathrm{el}}$ | $\Delta C_{\mathrm{el}}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{PH}_{3}$ | -5.215 | -4.259 | +0.02246 | -0.03409 | +5.512 | -7.358 |
| $\mathrm{PD}_{3}$ | -1.931 | -1.527 | +0.009707 | -0.01706 | +1.236 | -1.842 |
| $\mathrm{PF}_{3}$ | -0.09313 | -0.09126 | -0.06673 | -0.03897 | -0.9509 | -0.3413 |
| $\mathrm{PH}_{3} \mathrm{~F}_{2}$ | -0.1062 | $-4.306^{d}$ | -0.05868 | $-0.3091^{d}$ | -0.5119 | $-48.99^{d}$ |
| $\mathrm{PD}_{3} \mathrm{~F}_{2}$ | -0.09665 | $-1.519^{d}$ | -0.05711 | $-0.1547^{d}$ | -0.4849 | $-12.27^{d}$ |

${ }^{a}$ See footnote $a$ of Table S1.
${ }^{b}$ The $\Delta X_{\text {vib }}$ values were computed at the level of $\operatorname{CCSD}(\mathrm{T}) / \mathrm{AVQZ}$ for $\mathrm{PH}_{3}, \mathrm{PD}_{3}$, and $\mathrm{PF}_{3}$, and $\operatorname{CCSD}(\mathrm{T}) / \mathrm{VQZ}$ for $\mathrm{PH}_{3} \mathrm{~F}_{2}$ and $\mathrm{PD}_{3} \mathrm{~F}_{2}$ at the associated optimized equilibrium geometries (see Tables 3-4 of the main paper; the $\operatorname{CCSD}(\mathrm{T}) / \mathrm{AVQZ}$ geometry of $\mathrm{PH}_{3}$ is as follows: $r_{\mathrm{e}}(\mathrm{PH})=$ $\left.141.51 \mathrm{pm}, \theta_{\mathrm{e}}(\mathrm{HPH})=93.559^{\circ}\right)$. The $g$ factors as well as $\Delta X_{\mathrm{el}}$ were always calculated at the $\operatorname{CCSD}(\mathrm{T}) / A W C V T Z$ level at the corresponding best estimated equilibrium geometries (see Tables 2-4 of the main paper).
${ }^{c}$ For $\mathrm{PH}_{3}, \mathrm{PD}_{3}, \mathrm{PF}_{3}$, and $\mathrm{PH}_{3} \mathrm{~F}_{2}$ the respective experimental ground-state rotational constants used to determine a semiexperimental equilibrium structure (see Tables 2-4 and relevant references in the main paper) are given in $\mathrm{cm}^{-1}$. Therefore, we report the $\Delta X_{\text {vib }}$ and $\Delta X_{\text {el }}$ values of these species in the same unit (instead of MHz as in Table S1). The computed values for $\mathrm{PD}_{3} \mathrm{~F}_{2}$ serve as predictions.
${ }^{d}$ The entry refers to $\Delta A_{\text {vib }}, g_{\text {aa }}$, and $\Delta A_{\text {el }}$, respectively, due to the fact that $\mathrm{PH}_{3} \mathrm{~F}_{2}$ and $\mathrm{PD}_{3} \mathrm{~F}_{2}$ are prolate tops.
