General. Unless stated otherwise, all reactions were carried out under argon atmosphere in flame dried Schlenk glassware. The solvents were purified by distillation over the indicated drying agents under argon: THF ( Mg /anthracene), $\mathrm{Et}_{2} \mathrm{O}$ ( Mg /anthacene), pentane ( $\mathrm{Na} / \mathrm{K}$ ), $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(\mathrm{CaH}_{2}\right)$. MeCN and $\mathrm{Et}_{3} \mathrm{~N}$ were dried by an absorption solvent purification system based on molecular sieves. Flash chromatography: VWR Chemicals silica gel $40-63 \mu \mathrm{~m}$. TLCs were stained with vanillin $/ \mathrm{H}_{2} \mathrm{SO}_{4}$, anisaldehyde or PMA.
$\mathrm{C}_{6} \mathrm{~F}_{6}$ was purchased from $A B C R$ and used as received

NMR spectra were recorded on Bruker DPX 300, AV 400, AV 500 or AV III 600 spectrometers in the solvents indicated; chemical shifts are given in ppm relative to TMS, coupling constants ( $J$ ) in Hz . The solvent signals were used as references and the chemical shifts converted to the TMS scale $\left(\mathrm{CDCl}_{3}: \delta_{\mathrm{C}}=77.2 \mathrm{ppm}\right.$; residual $\mathrm{CHCl}_{3}: \delta_{\mathrm{H}}=7.26 \mathrm{ppm} ; \mathrm{CD}_{2} \mathrm{Cl}_{2}: \delta_{\mathrm{C}}=54.0 \mathrm{ppm} ;$ residual $\mathrm{CHDCl}_{2}: \delta_{\mathrm{H}}=5.32 \mathrm{ppm} ;\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}: \delta_{\mathrm{C}}=39.5 \mathrm{ppm} ;$ residual $\left(C D_{3}\right)\left(\mathrm{CD}_{2} \mathrm{H}\right) \mathrm{SO}: \delta_{H}=2.50 \mathrm{ppm} ; \mathrm{C}_{6} \mathrm{D}_{6}: \delta_{\mathrm{C}}=128.1 \mathrm{ppm}$; residual $\left.\mathrm{C}_{6} \mathrm{D}_{5} \mathrm{H}: \delta_{H}=7.16 \mathrm{ppm}\right)$. Proton and carbon assignments were established using HSQC, HMBC and NOESY experiments.

IR: Alpha Platinum ATR (Bruker), wavenumbers ( $\tilde{\text { v }}$ ) in $\mathrm{cm}^{-1}$.

MS (EI): Finnigan MAT 8200 ( 70 eV ), ESI-MS: ESQ 3000 (Bruker) or Thermo Scientific LTQ-FT or Thermo Scientific Exactive. HRMS: Bruker APEX III FT-MS (7 T magnet) or MAT 95 (Finnigan) or Thermo Scientific LTQ-FT or Thermo Scientific Exactive. GC-MS was measured on a Shimadzu GCMS-QP2010 Ultra instrument.

HPLC analyses for the determination of enantiomeric excesses were conducted on a Shimadzu LC 2020 instrument equipped with a Shimadzu SPD-M2OA UV/VIS detector. Solvents were purchased in HPLC grade and used without further purification. The exact conditions are specified for each substrate.

Optical rotations were measured with an A-Krüss Otronic Model P8000-t polarimeter at a wavelength of 589 nm . The values are given as specific optical rotation with exact temperature, concentration (c/(10 mg/mL)) and solvent.

Unless stated otherwise, all commercially available compounds (abcr, Acros, TCI, Aldrich, Alfa Aesar, Fluoro Chem) were used as received.

## C-H Insertion Reactions

General procedure A: Pentane as the Solvent. An oven-dried jacketed Schlenk flask equipped with a magnetic stir bar was charged with the [BiRh] catalyst ( $0.0005 \mathrm{mmol}, 0.5 \mathrm{~mol} \%$ ) under argon. The substrate $(0.25 \mathrm{mmol})$ and pentane $(1 \mathrm{~mL})$ were added to the catalyst and the resulting solution cooled to $-10^{\circ} \mathrm{C}$. A solution of the diazo compound ( 0.1 mmol ) in pentane ( 3 mL ) was added dropwise over 60 min . The resulting mixture was stirred at $-10^{\circ} \mathrm{C}$ until TLC analysis indicated the complete consumption of the diazo compound. For work up, the mixture was absorbed on silica, which was loaded on top of a silica column.

Purification by flash chromatography (n-pentane/Et $\mathrm{F}_{2} \mathrm{O}$ or hexanes/EtOAc) afforded the desired $\mathrm{C}-\mathrm{H}$ insertion product.

General procedure B: $\mathbf{C}_{6} \mathbf{F}_{6}$ as the Solvent. An oven dried Schlenk flask equipped with a magnetic stir bar was charged with the [BiRh] catalyst ( $0.0005 \mathrm{mmol}, 0.5 \mathrm{~mol} \%$ ) under argon. The alkane substrate (0.4 mmol ) and $\mathrm{C}_{6} \mathrm{~F}_{6}(1 \mathrm{~mL})$ were added. A solution of the diazo compound ( 0.1 mmol ) in $\mathrm{C}_{6} \mathrm{~F}_{6}(3 \mathrm{~mL})$ was added dropwise over 20 min . The resulting mixture was stirred at ambient temperture until TLC analysis indicated the complete consumption of the diazo compound ( 5 min to 2 h ). For work up, the mixture was absorbed on silica, which was loaded on top of a silica column. Purification by flash chromatography (n-pentane/Et ${ }_{2} \mathrm{O}$ or hexanes/EtOAc) afforded the desired C-H insertion product.

Larger Scale Experiment. Preparation of 2,2,2-Trichloroethyl (R)-3-(cyclopentyloxy)-2-(4-fluorophenyl) propanoate (20d). An oven dried Schlenk flask equipped with a magnetic stir bar was charged with catalyst 7b ( $4.4 \mathrm{mg}, 0.0015 \mathrm{mmol}, 0.1 \mathrm{~mol} \%$ ) under argon. Cyclopentyl methyl ether ( $0.875 \mathrm{~mL}, 7.5 \mathrm{mmol}$ ) and pentane ( 15 mL ) were added and the resulting solution was cooled to $-10{ }^{\circ} \mathrm{C}$. A solution of the diazo derivative 8 c ( $468 \mathrm{mg}, 1.5 \mathrm{mmol}$ ) in pentane ( 45 mL ) was added dropwise over 2 h . The resulting mixture was stirred at $-10^{\circ} \mathrm{C}$ during 18 h . For work up, the mixture was absorbed on silica, which was then loaded on top of a silica column. Purification by flash chromatography (hexanes/tert-butyl methyl ether, 98:2) afforded the title compound as a colorless liquid ( $494.1 \mathrm{mg}, 86 \%$ yield, $99 \%$ ee). The analytical data are compiled below.

Stereochemical Assignment. The absolute configuration of the products was assigned in analogy to the stereostructure of product 23b determined by X-ray diffraction (Figure S1). In case of products $\mathbf{1 2}$ and 20e, this tentative assignment could be confirmed by comparison with literature data.

For work up, the mixture was absorbed on silica, which was loaded on top of a silica column. C-H Insertion into the Pentane Solvent. ## Reaction with Gaseous Substrates

Representative Procedure for C-H Insertion into Ethane. 2,2,2-Trichloroethyl (S)-2-(4fluorophenyl)butanoate (34a). A 45 mL stainless steel autoclave equipped with a magnetic stir bar was charged with the catalyst ( $0.001 \mathrm{mmol}, 1 \mathrm{~mol} \%$ ). The autoclave was evacuated and backfilled with argon 3 times and then purged with ethane. $\mathrm{C}_{6} \mathrm{~F}_{6}(1 \mathrm{~mL})$ was added and the autoclave was pressurized with ethane to $\approx 25$ bar. A solution of the diazo derivative $8 \mathrm{c}(31.2 \mathrm{mg}, 0.1 \mathrm{mmol})$ in $\mathrm{C}_{6} \mathrm{~F}_{6}(3 \mathrm{~mL})$ was added dropwise over 30 min to the pressurized autoclave with the help of an hplc pump. After the addition was complete, the mixture was left stirring at room temperature for 2 h . The pressure was carefully released and the mixture was absorbed on silica, which was loaded on top of a silica column. Purification by flash chromatography (hexanes/EtOAc) afforded the title compound; with complex 7b: $80 \%$ yield, $90 \%$ ee; with complex 7d: 61\% yield, $95 \%$ ee.  carboxylate (35). A 45 mL stainless steel autoclave equipped with a magnetic stir bar was charged with catalyst 7b ( $1.45 \mathrm{mg}, 0.0005 \mathrm{mmol}, 0.5 \mathrm{~mol} \%$ ). The autoclave was evacuated and backfilled with argon 3 times and purged with propene. Pentane (1 mL ) was added and the autoclave was pressurized with propene to 9 bar. A solution of the diazo compound $8 \mathrm{c}(31.2 \mathrm{mg}, 0.1 \mathrm{mmol})$ in pentane ( 3 mL ) was added over 30 min into the pressurized autoclave with the help of an hplc pump. After the addition was complete, the reaction mixture was left stirring at room temperature for 2 h before the pressure was carefully released and the reaction mixture was absorbed on silica, which was loaded on top of a silica column. Purification by flash chromatography (hexanes/EtOAc) afforded the title compound as a colorless liquid ( $28.0 \mathrm{mg}, 86 \%$ yield, 94\% ee).
