

Supplementary Material

1 Supplementary Analyses of Averaged ROIs

To further examine the lateralization of ERP components and make the results clearer, we subsequently averaged the lateral ROIs on the left (F3, FC3, F7, FT7, C3, T7, CP3, P3, TP7, and P7) and right (F4, FC4, F8, FT8, C4, T8, CP4, P4, TP9, and P8) hemispheres and conducted a 2-way ANOVA on N400 and P600 data for L1 and L2 groups, respectively, with condition (NORM, SEM, and SEM + SYN) and hemisphere (left and right) as factors.

N400 results

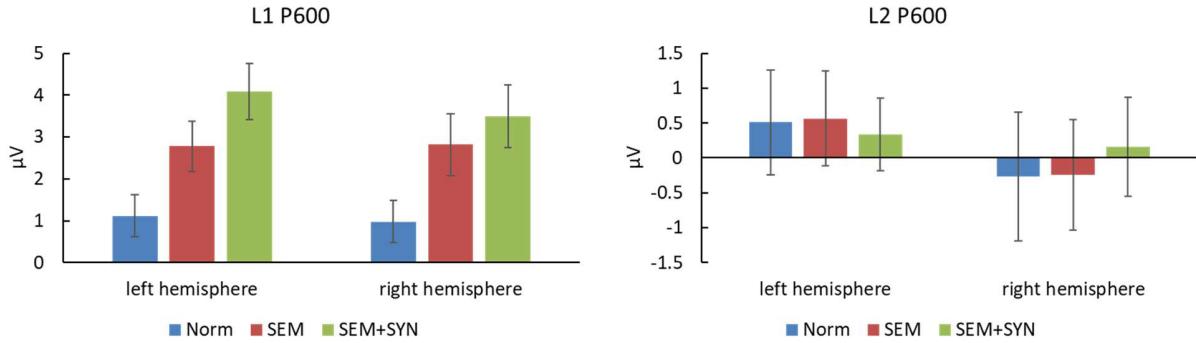

Supplementary Figure 1. Amplitudes at averaged ROIs in the left and right hemispheres in N400 time window (250-420 ms time window for L1 and 300-500 ms time window for L2).

L1 data revealed a significant condition effect [$F(2, 38) = 17.20, p <.001, \eta_p^2 = .475$]. A *post hoc* comparative analysis further showed that SEM + SYN ($M = 1.126 \pm 2.406 \mu\text{V}$) and SEM ($M = 1.035 \pm 2.140 \mu\text{V}$) elicited more negative waves than NORM ($M = 2.142 \pm 2.101 \mu\text{V}$; $p <.05$), while no difference was detected between SEM + SYN and SEM ($p = .091$). The main effect of hemisphere [$F(1, 19) = .60, p = .809$] and the interaction between hemisphere and condition [$F(2, 38) = 2.41, p = .104$] were not significant (Supplementary Figure 1).

L2 data manifested similar patterns as L1 data in N400 time window. A main effect of condition was detected [$F(2, 38) = 7.34, p = .009, \eta_p^2 = .279$]. A *post hoc* comparative analysis further showed that SEM + SYN ($M = -.851 \pm 1.854 \mu\text{V}$) and SEM ($M = -.027 \pm 1.987 \mu\text{V}$) elicited more negative waves than NORM ($M = .961 \pm 2.771 \mu\text{V}$; $p <.05$), while no difference was detected between SEM + SYN and SEM ($p = .334$). The main effect of hemisphere [$F(1, 19) = .12, p = .734$] and the interaction between hemisphere and condition [$F(2, 38) = .76, p = .433$] were not significant (Supplementary Figure 1).

P600 results

Supplementary Figure 2. Amplitudes at averaged ROIs in the left and right hemisphere in P600 time window (430-600 ms time window for L1 and 600-750 ms time window for L2).

L1's P600 results yielded a significant main effect of condition [$F(2, 38) = 11.79, p <.001, \eta_p^2 = .383$]. A *post hoc* comparative analysis further showed that SEM + SYN ($M = 3.787 \pm 2.986 \mu\text{V}$) and SEM ($M = 2.800 \pm 2.856 \mu\text{V}$) elicited more positive waves than NORM ($M = 1.046 \pm 2.049 \mu\text{V}$; $p <.01$), while no difference was detected between SEM + SYN and SEM ($p = .305$). The main effect of hemisphere [$F(1, 19) = .39, p = .539$] and the interaction between hemisphere and condition [$F(2, 38) = 1.03, p = .366$] were not significant (Supplementary Figure 2).

The P600 results in the L2 group manifested a distinct pattern from L1 speakers such that neither significant main effects [$Fs(2, 38) < .93, ps > .348$] nor a significant interaction [$F(2, 38) = 1.16, p = .324$] was detected (Supplementary Figure 2).

The supplementary analyses manifested only main condition effect for all time windows except P600 window for L2, such that SEM + SYN and SEM elicited more positive waves than NORM, while no difference was detected between SEM + SYN and SEM. No lateralization or interaction was detected in the supplementary analyses. These results are consistent with analyses on separated lateral ROIs.

2 Supplementary Tables

The means and standard deviations of amplitudes as well as latencies of every time window and every electrode or ROI for both L1 and L2 groups are given below in form of tables.

Supplementary Table 1. Amplitudes (μ V) at midline electrodes in the ELAN time window (100-200 ms).
