SCIENCE • 28 Aug 2015 • Vol 349, Issue 6251 • DOI: 10.1126/science.aac4716

“39% of effects were subjectively rated to have replicated the original result.”

A personal story

Professor

There is this effect. Run this experiment and show the effect!

PhD

When I was a research intern...

Professor

But the whole field says this effect does not exist...

PhD

When I was a research intern...

Professor

That is exactly why we should try to show it does exist!

PhD

When I was a research intern...

Professor

PhD

When I was a research intern...

$p > 0.05$

*"You failed experiment!
Run it again"*

When I was a research intern...

*"You failed experiment!
Run it again"*

*"You failed again!
Change these parameters,
and run it again!"*

When I was a research intern...

*“You failed experiment!
Run it again”*

*“You failed again! Change these parameters,
and run it again!”*

*“I think you can do a better job.
Change these parameters,
and run it again!”*

When I was a research intern...

$p > 0.05$

$p > 0.05$

$p > 0.05$

$p < 0.05$

*“Publish this!
You can graduate now!”*

False Positive

*“You failed experiment!
Run it again”*

*“You failed again! Change these parameters,
and run it again!”* *“I think you can do a better job.
Change these parameters,
and run it again!”*

When I was a research intern...

I am done with
academia! I will give up
my PhD and graduate
as a master...

When I was a research intern...

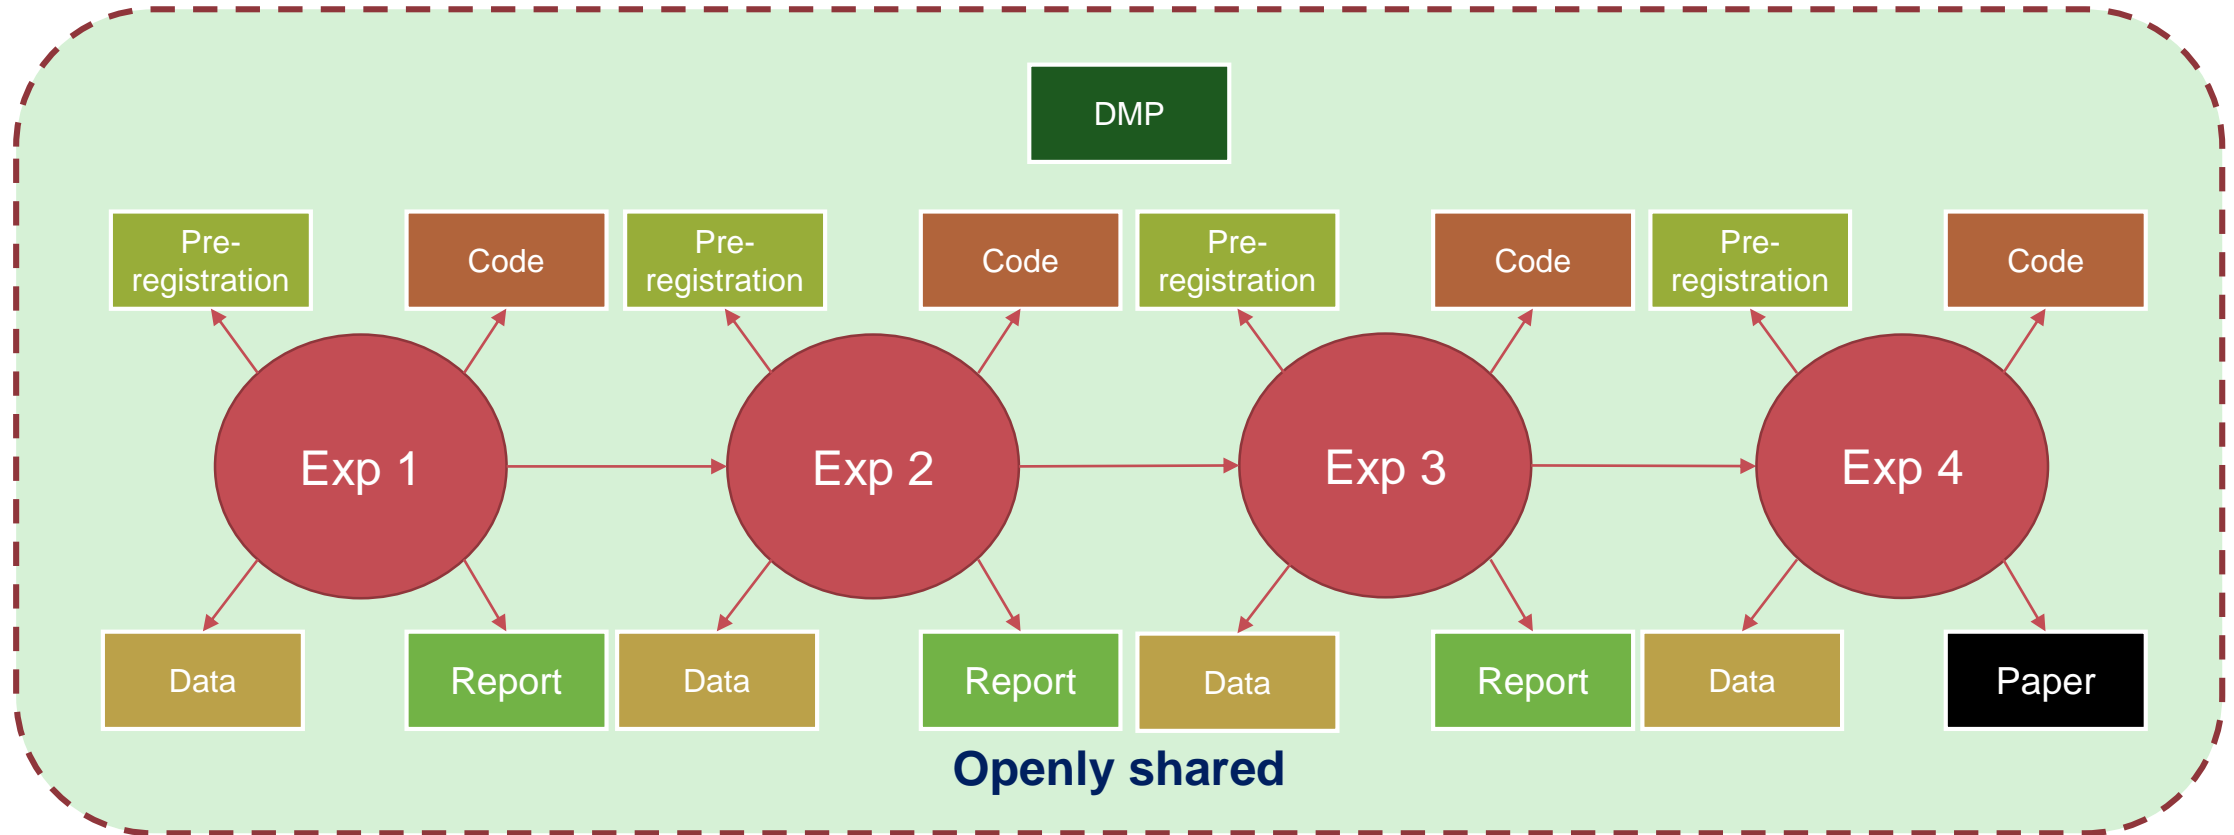

Me

No wonder there is
replication crisis in
psychology.
I swear I won't do my PhD
in this way!
This is unFAIR for science!

When I was a research intern...

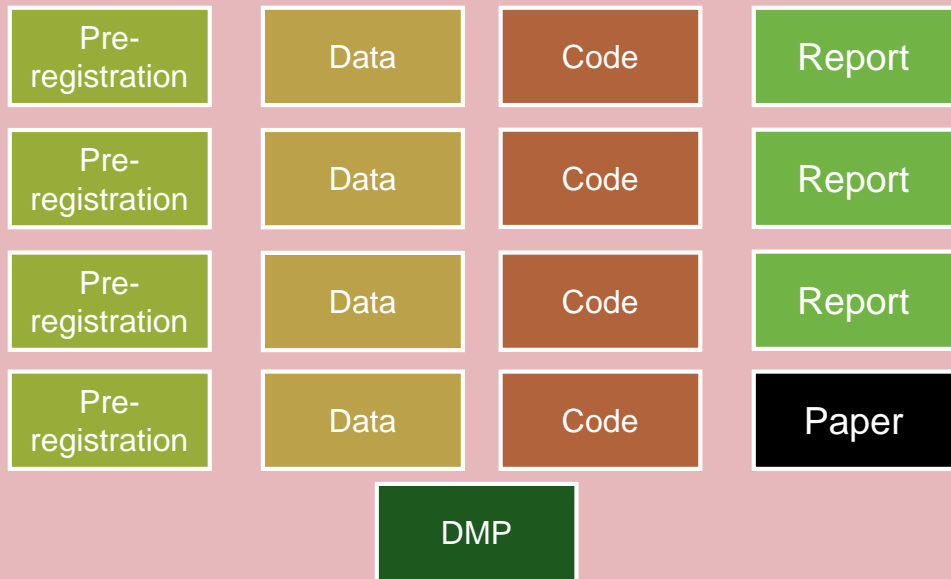

Now I am a PhD

My workload for one paper

Other people's workload for one paper

Now I am a PhD

Damn it!
What I am doing
is
FAIR for science
unFAIR for me!!!

What my work potential employer cares

Paper

What other work potential employer cares

Paper

Now I am a PhD

This won't work!
If I work for equal amount of time as
others, I will publish much less papers
than the others.
In the end, I will fail myself in the system!

Now I am a PhD

Wait, first let me figure out how much extra time has it costed to be FAIR for science in the past 2 years.

I am recording the extra time costs on depositing these outputs on the weekly basis

Pre-registration	Data	Code	Report
Pre-registration	Data	Code	Report
Pre-registration	Data	Code	Report
Pre-registration	Data	Code	

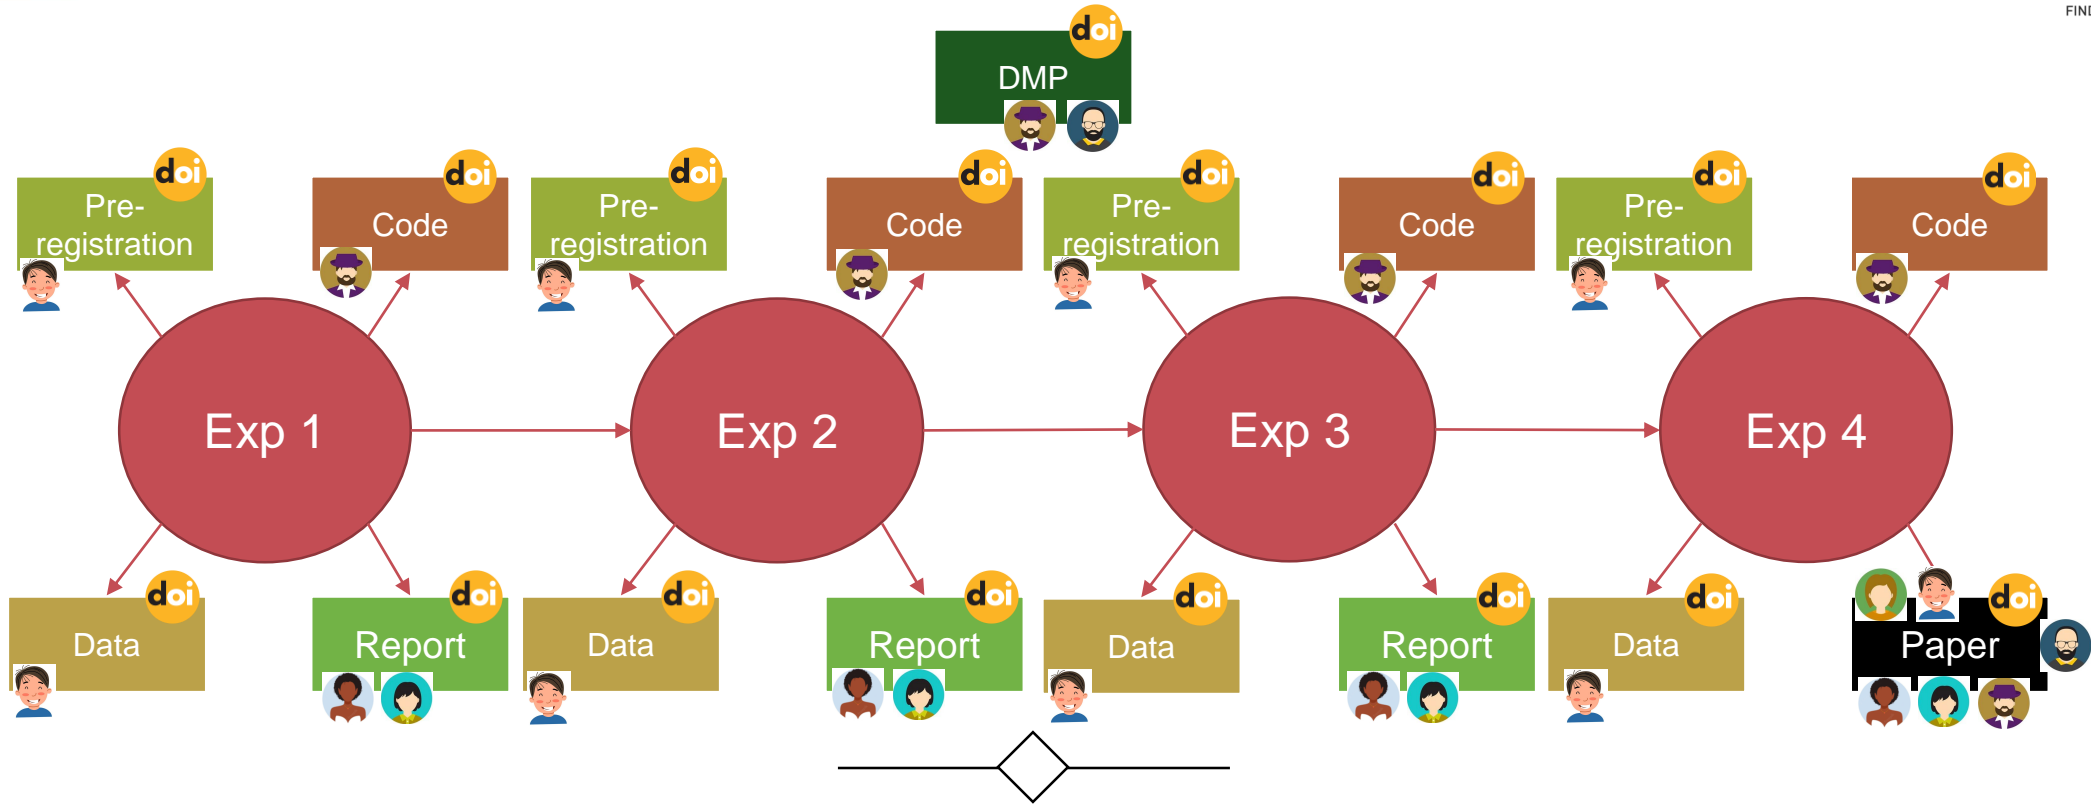

Now I am a PhD

$$\text{Extra work load} = \frac{\text{Extra time cost}}{\text{Total working time}} = \sim 10\%$$

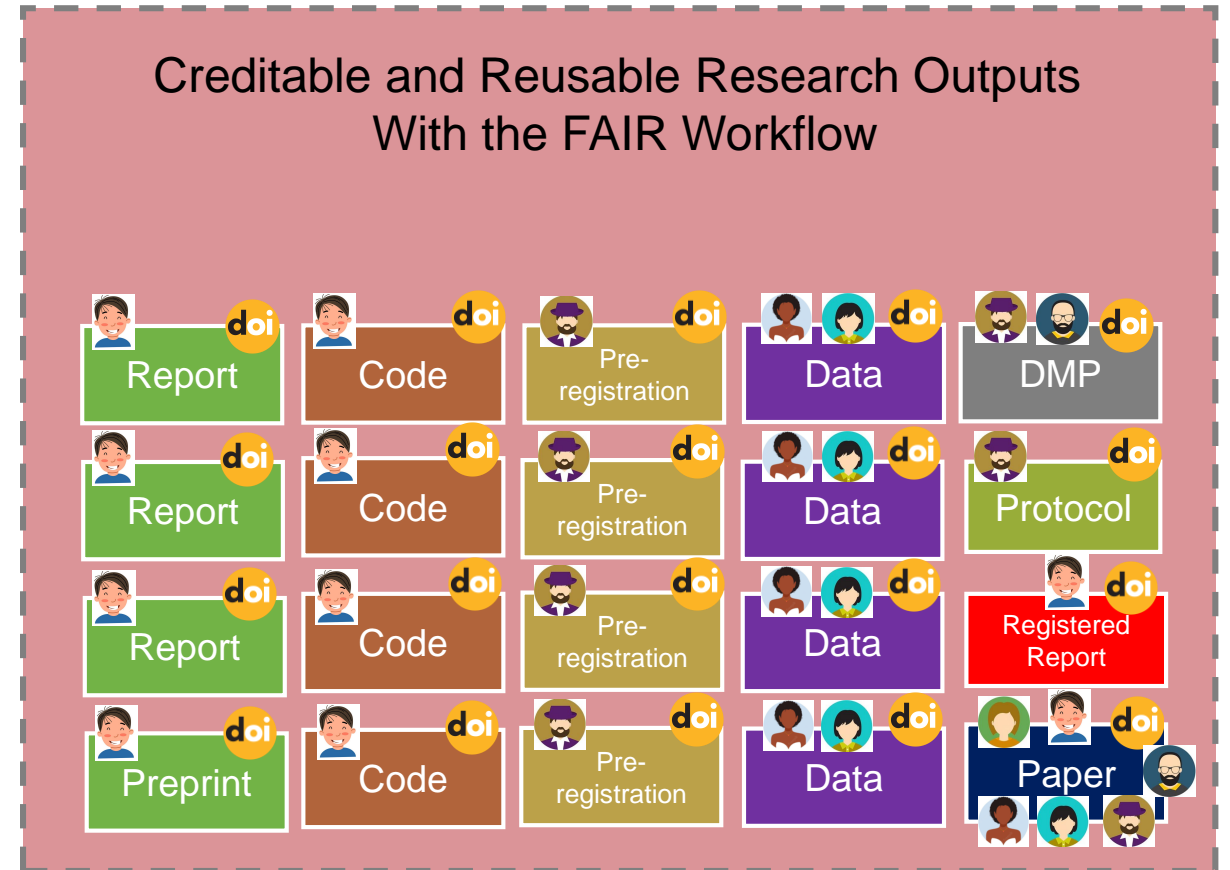

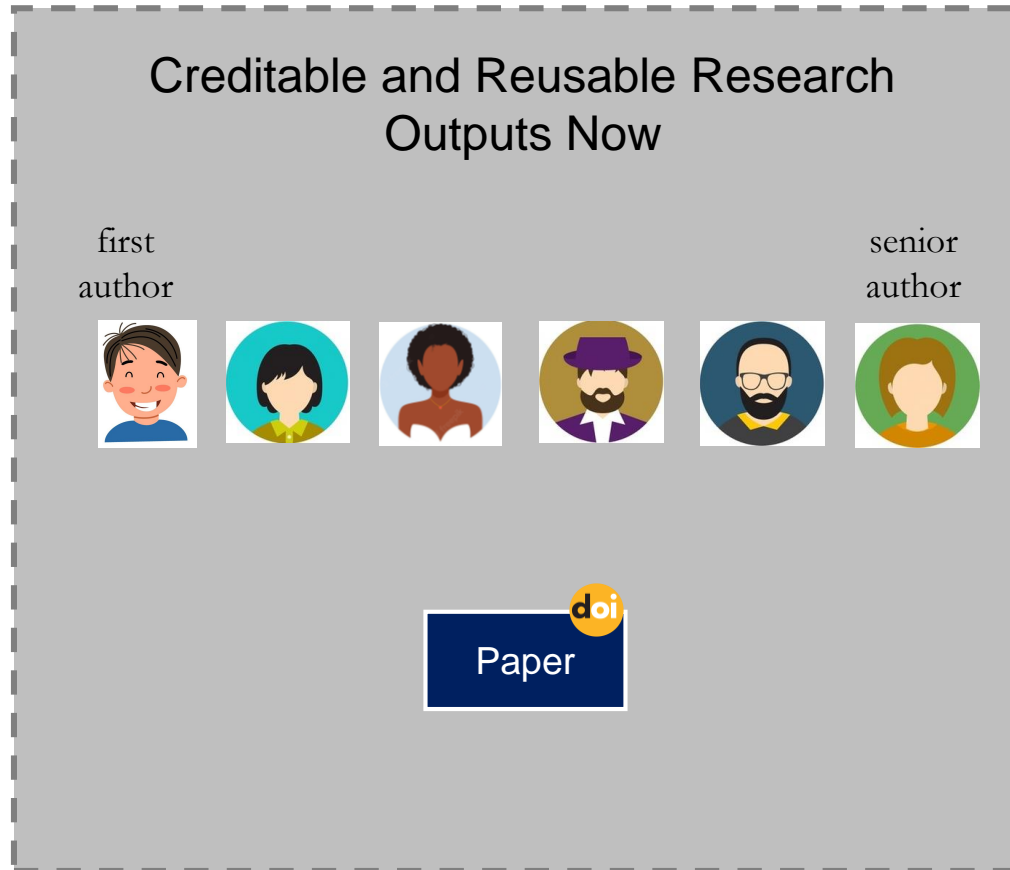

It is all about credits.
What if we make these extra outputs also creditable?

Now I am a PhD

Transforming the Ecology of Academic Crediting System

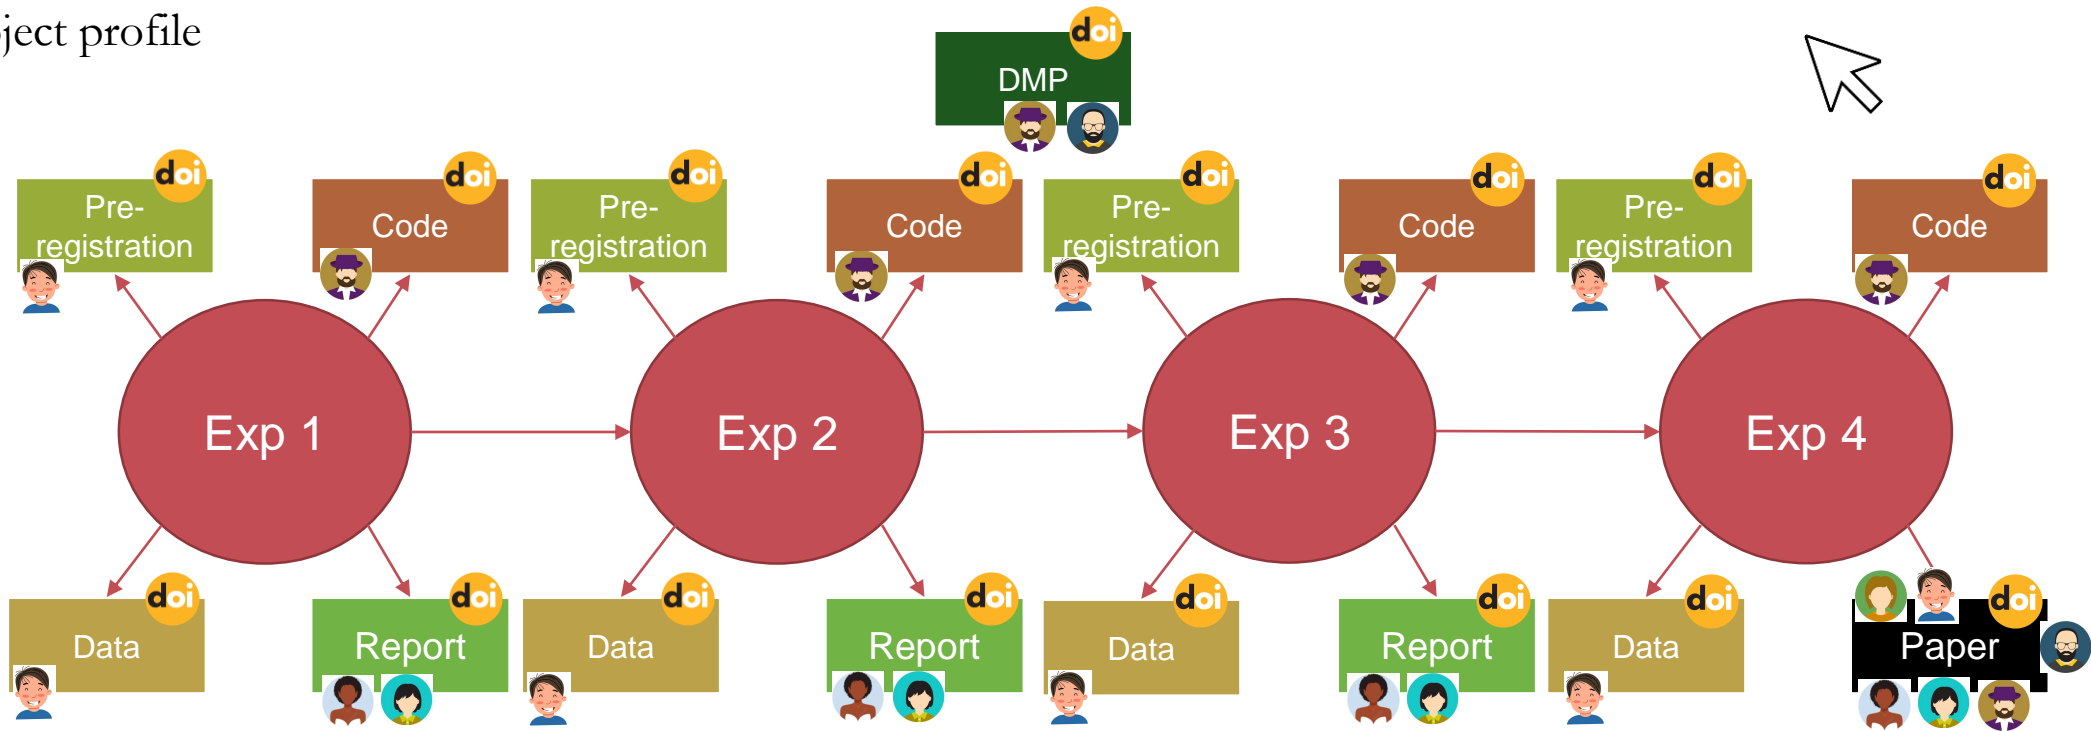

Now I am a PhD

SECTION 2:
A WORKSHOP ON
PRE-REGISTRATION

Pre-registration

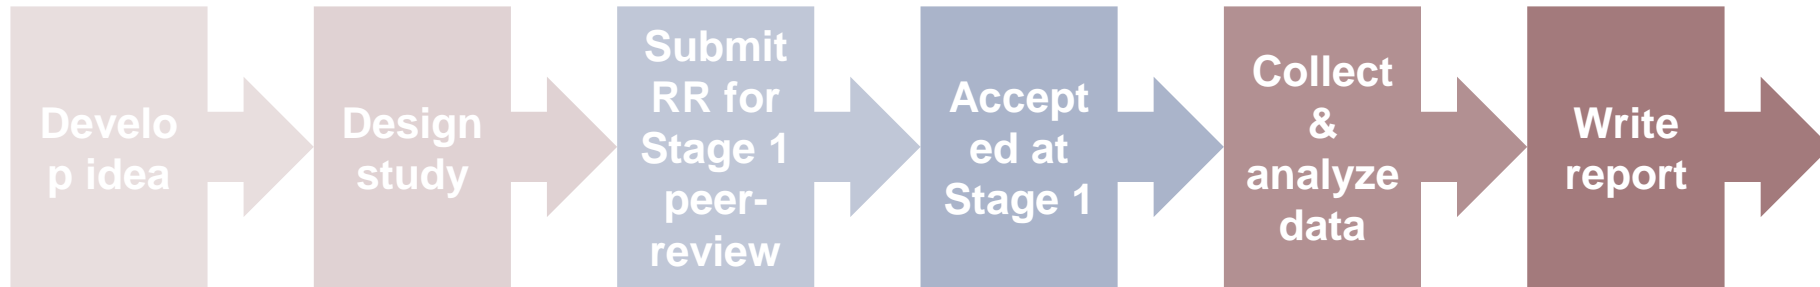

The practice of registering the **hypotheses**, **methods**, and/or **analyses** of a scientific study before it is conducted.

Pre-registration is different from registered report.

Pre-registration workflow

Registered-report workflow

Pre-registration reduces the likelihood of positive results.

Registered report reduces the likelihood of positive results.

Scheel, A. M., Schijen, M. R. M. J., & Lakens, D. (2021). An Excess of Positive Results: Comparing the Standard Psychology Literature With Registered Reports. *Advances in Methods and Practices in Psychological Science*, 4(2), 251524592110074

Pre-registration

Registered-reports

Advantages

1. Less time consuming
2. Easy to register

1. Guarantees publication regardless of results
2. Peer-review prior to experimentation improves experiment quality

Disadvantages

1. Does not guarantee publication
2. Lack of quality control (no peer-review)

1. More time-consuming
2. Two times of peer-view could take a long long time

CC-By Attribution 4.0 International

Clarity how can others use your pre-registration

without your consent:

1. Whether copyright holder has control over the content versioning;
2. Whether one can copy, distribute and modify the content;
3. Whether one should give attribution to the creator when re-using it;

Template overview

Hypotheses *

List specific, concise, and testable hypotheses. Please state if the hypotheses are directional or non-directional. If directional, state the direction. A predicted effect is also appropriate here. If a specific interaction or moderation is important to your research, you can list that as a separate hypothesis.

[Hide example](#)

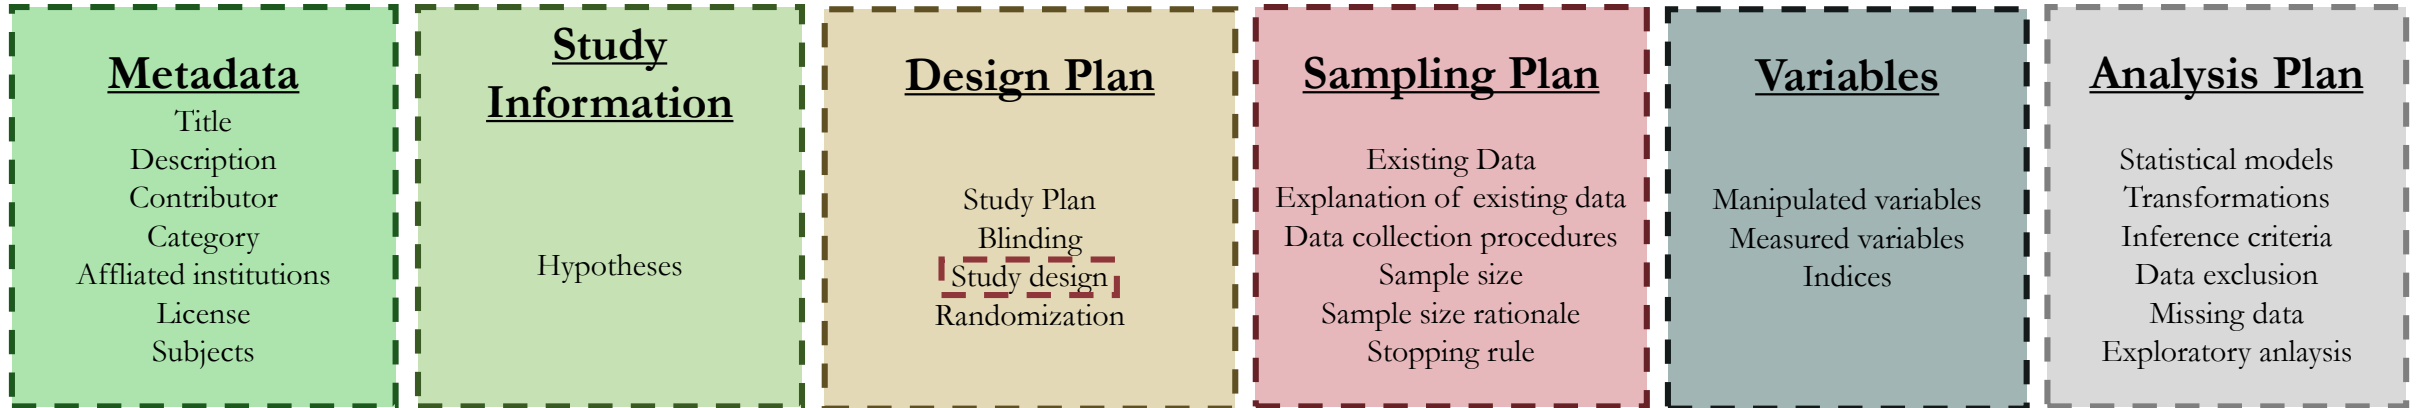

If taste affects preference, then mean preference indices will be higher with higher concentrations of sugar.

This field can't be blank.

A very specific statement of your hypotheses:

1. One point for each hypothesis;
2. Specific about the conditions of each hypothesis;
3. Specific about the empirical outcome measures;
4. Specific about the directions of the results;
5. You MUST report the results of this hypothesis testing in the manuscript as “pre-registered hypothesis”;
6. Any changes in real practice deviating from these statements must be

Template overview

Study design *

Describe your study design. The key is to be as detailed as is necessary given the specific parameters of the design. There may be some overlap between this question and the following questions. That is OK, as long as sufficient detail is given in one of the areas to provide all of the requested information. Examples include two-group, factorial, randomized block, and repeated measures. Is it a between (unpaired), within-subject (paired), or mixed design? Describe any counterbalancing required.

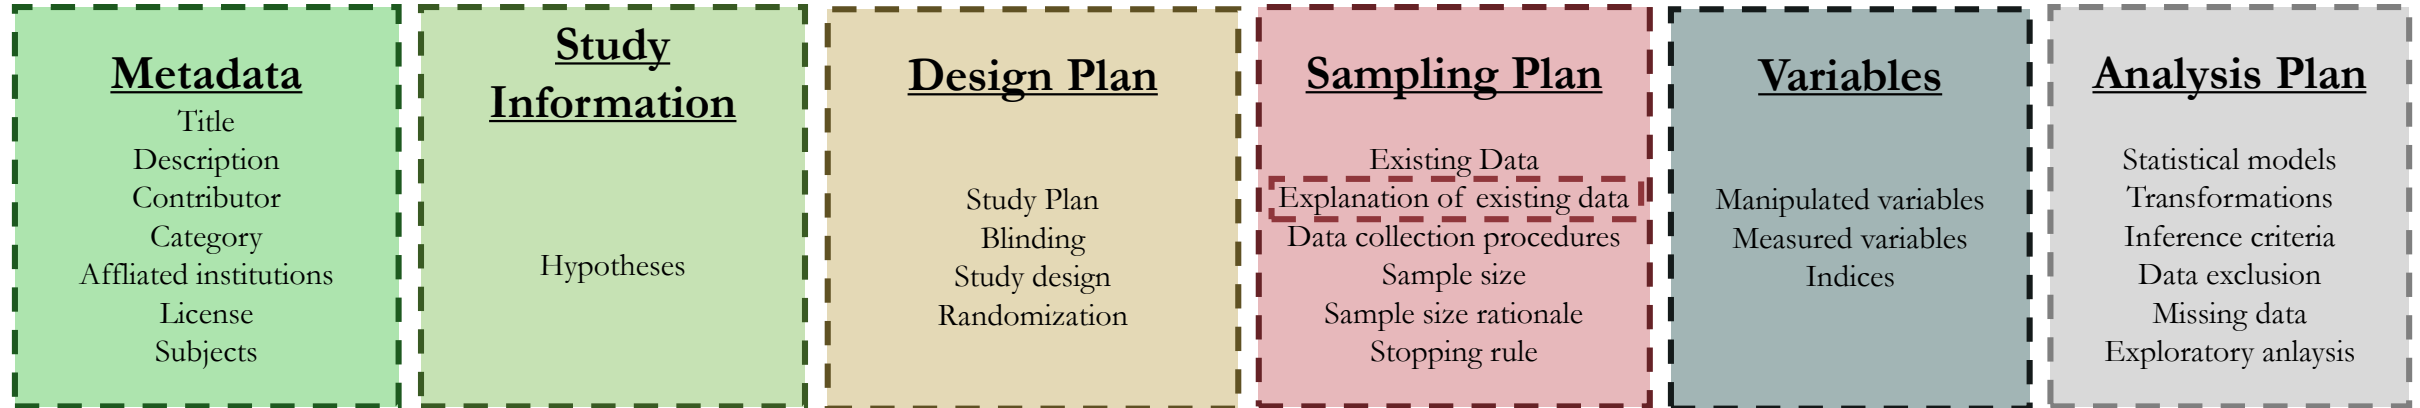

[Show example](#)

This field can't be blank.

Equivalent to experimental procedure and design in your manuscript:

1. Should be specific enough in experimental parameters so that others can replicate your experiment procedure;
2. You can also add figures as supplementary material;

Template overview

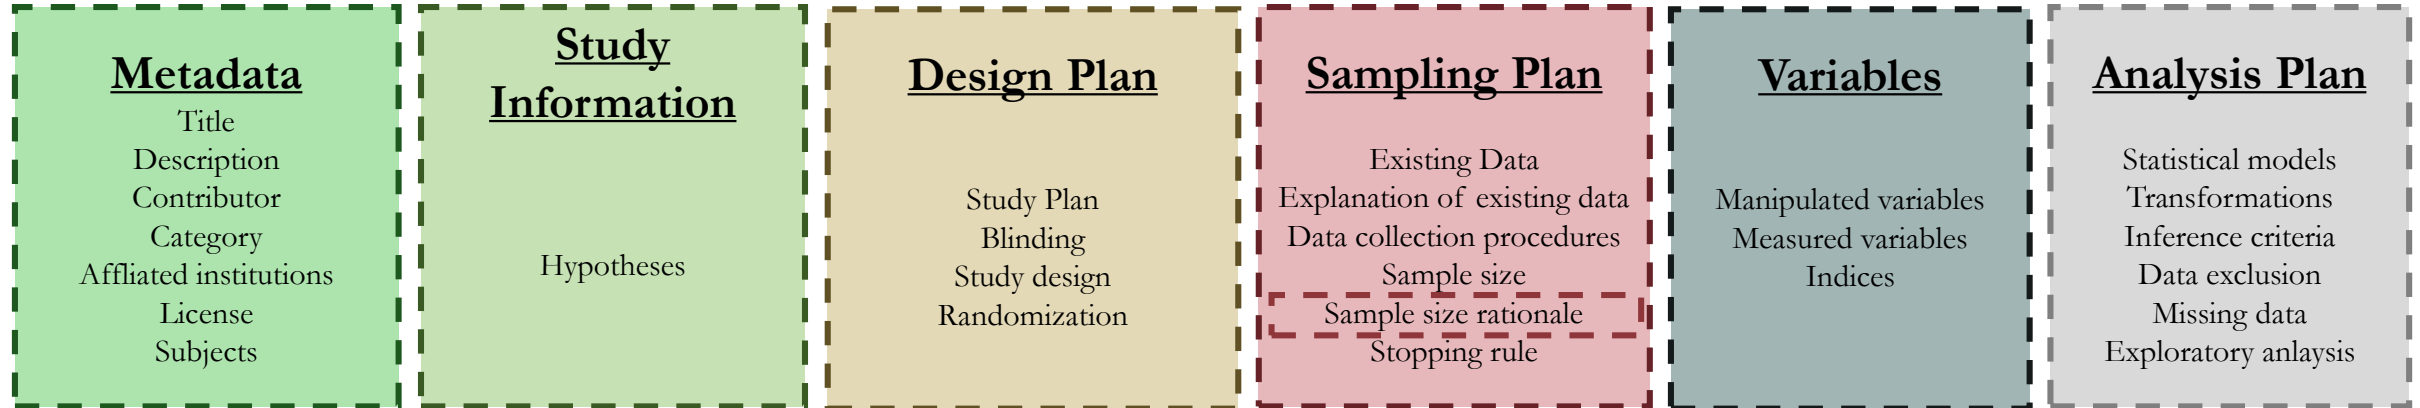

Explanation of existing data

If you indicate that you will be using some data that already exist in this study, please describe the steps you have taken to assure that you are unaware of any patterns or summary statistics in the data. This may include an explanation of how access to the data has been limited, who has observed the data, or how you have avoided observing any analysis of the specific data you will use in your study.

You can also pre-register analysis on an existing data:

1. Be honest whether you are already aware of the results of the pre-registered analysis;

Template overview

Sample size rationale

This could include a power analysis or an arbitrary constraint such as time, money, or personnel.

[Hide example](#)

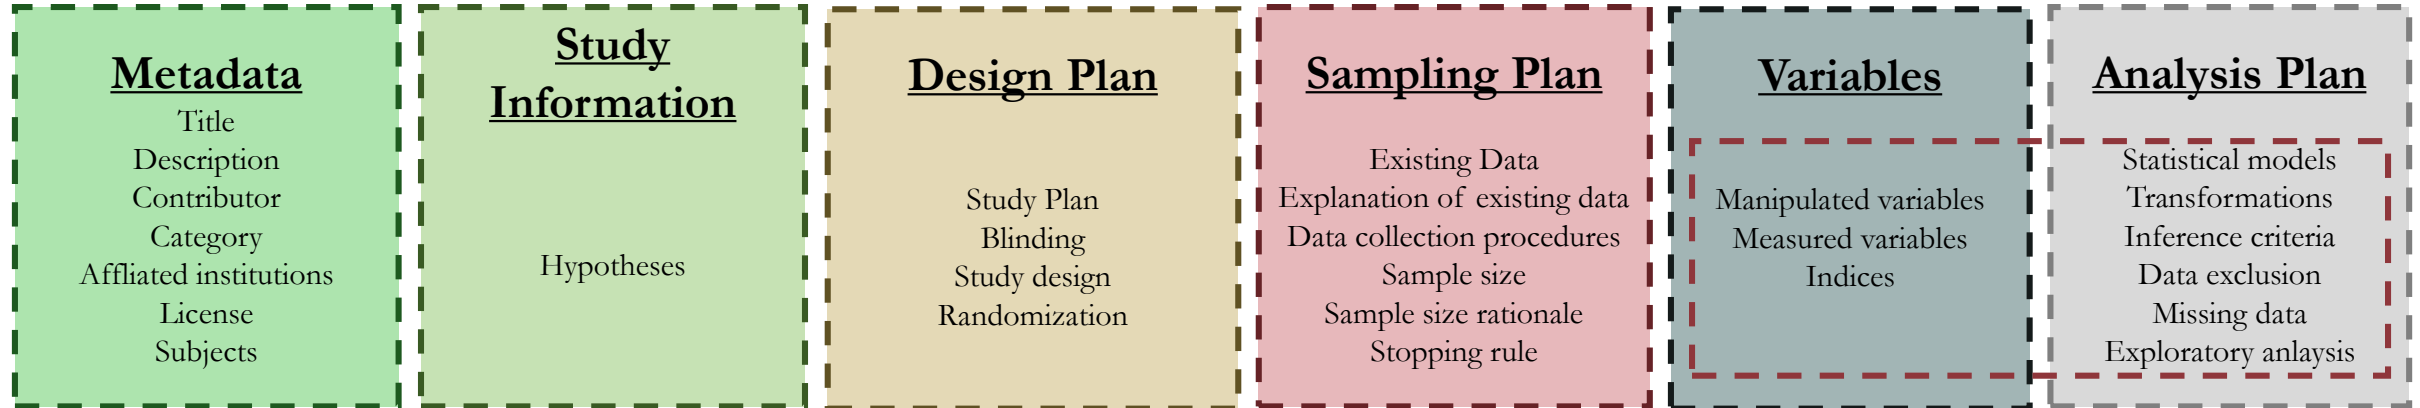

We used the software program G*Power to conduct a power analysis. Our goal was to obtain .95 power to detect a medium effect size of .25 at the standard .05 alpha error probability.

Motivate the planned sample size:

1. Power analysis has to be done to justify the sample size;
2. One should only pre-register a study if the planned sample size has enough power to detect the hypothesized effect size.

Metadata: Description

Basically the data analysis section:

1. In addition to the textual information, the best practice would be to write up the code and attach it to the analysis plan;
2. Given your data and these information, one should be able to completely replicate your analysis and results;
3. Any deviations in analysis in the final manuscript should be backed up by strong justifications;

Lessons from a large scale international open science project

Global Neuronal Workspace Theory

Questions?

Quiz

1. Pre-registration only applies to quantitative research.

Quiz

2. I don't need to pre-register the experiments, the sample size of which do not have enough power to detect the effect of interest.

Quiz

3. I do not need to clarify whether the data has been collected in the pre-registration as long as I haven't conducted the pre-registered analysis.

Quiz

4. I can report the results of the analysis that I did not pre-register in my paper.

Quiz

5. I cannot amend my pre-registration once it is published.

Quiz

6. I have to report the results of every single analysis I pre-register.

Quiz

7. My PhD is supported by a three-year-grant and I have five research projects planned out. I want to do a registered-report for every project.

Quiz

8. All my pre-registered results are negative. No journals want to accept my paper. There is no way I have share my results to the community.

Quiz

9. I have got a five-year grant. I want to replicate a highly influential paper in my field. I think pre-registration is better for me compared to registered report.

Quiz

10. I can draft a license myself for my pre-registration.
