

**Supplementary material: Body size interacts with the structure of the central nervous system: A multi-center *in vivo* neuroimaging study**

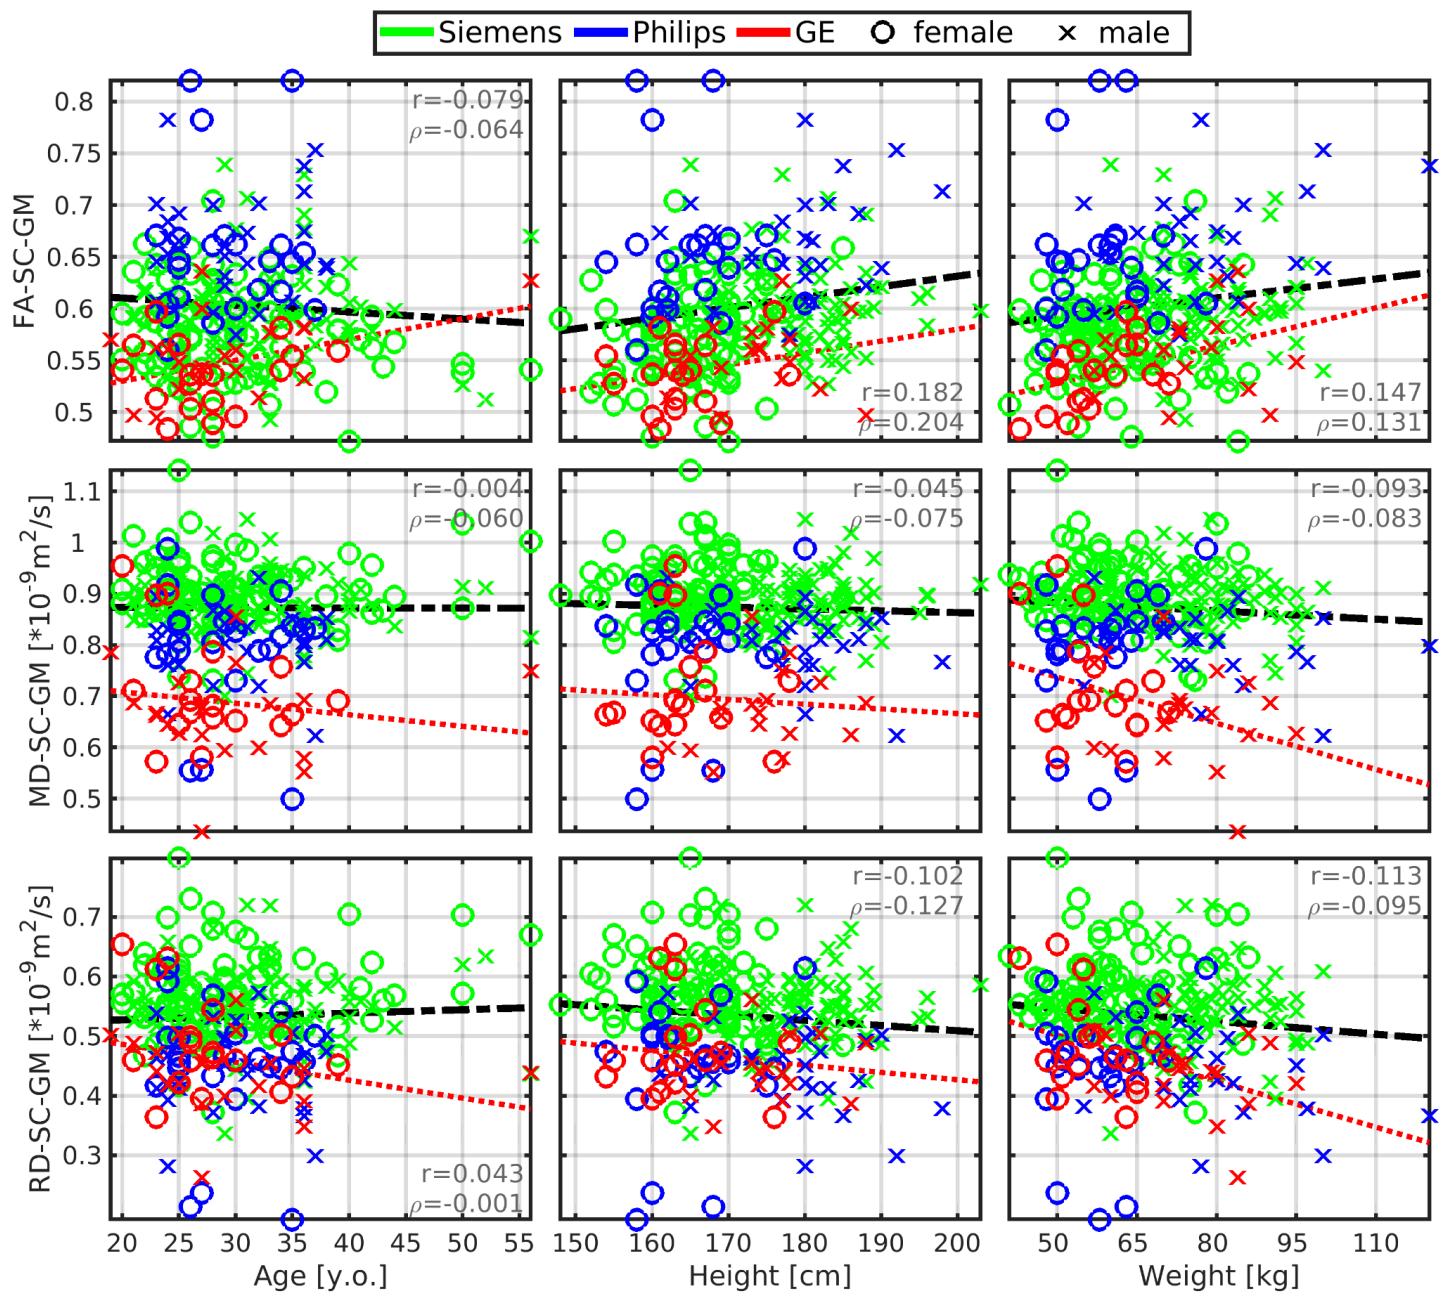

**Figure S1: Mean diffusivity in spinal cord (SC) white matter (WM) correlates to body weight.**

**Abbreviations:** WM - white matter; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; RD - radial diffusivity;  $r$  - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. Plots with statistically significant correlation ( $p_{\text{FWE}} < 0.05$ ) are highlighted with yellow background, and corresponding  $r$  and  $\rho$  values are highlighted with black bold font.

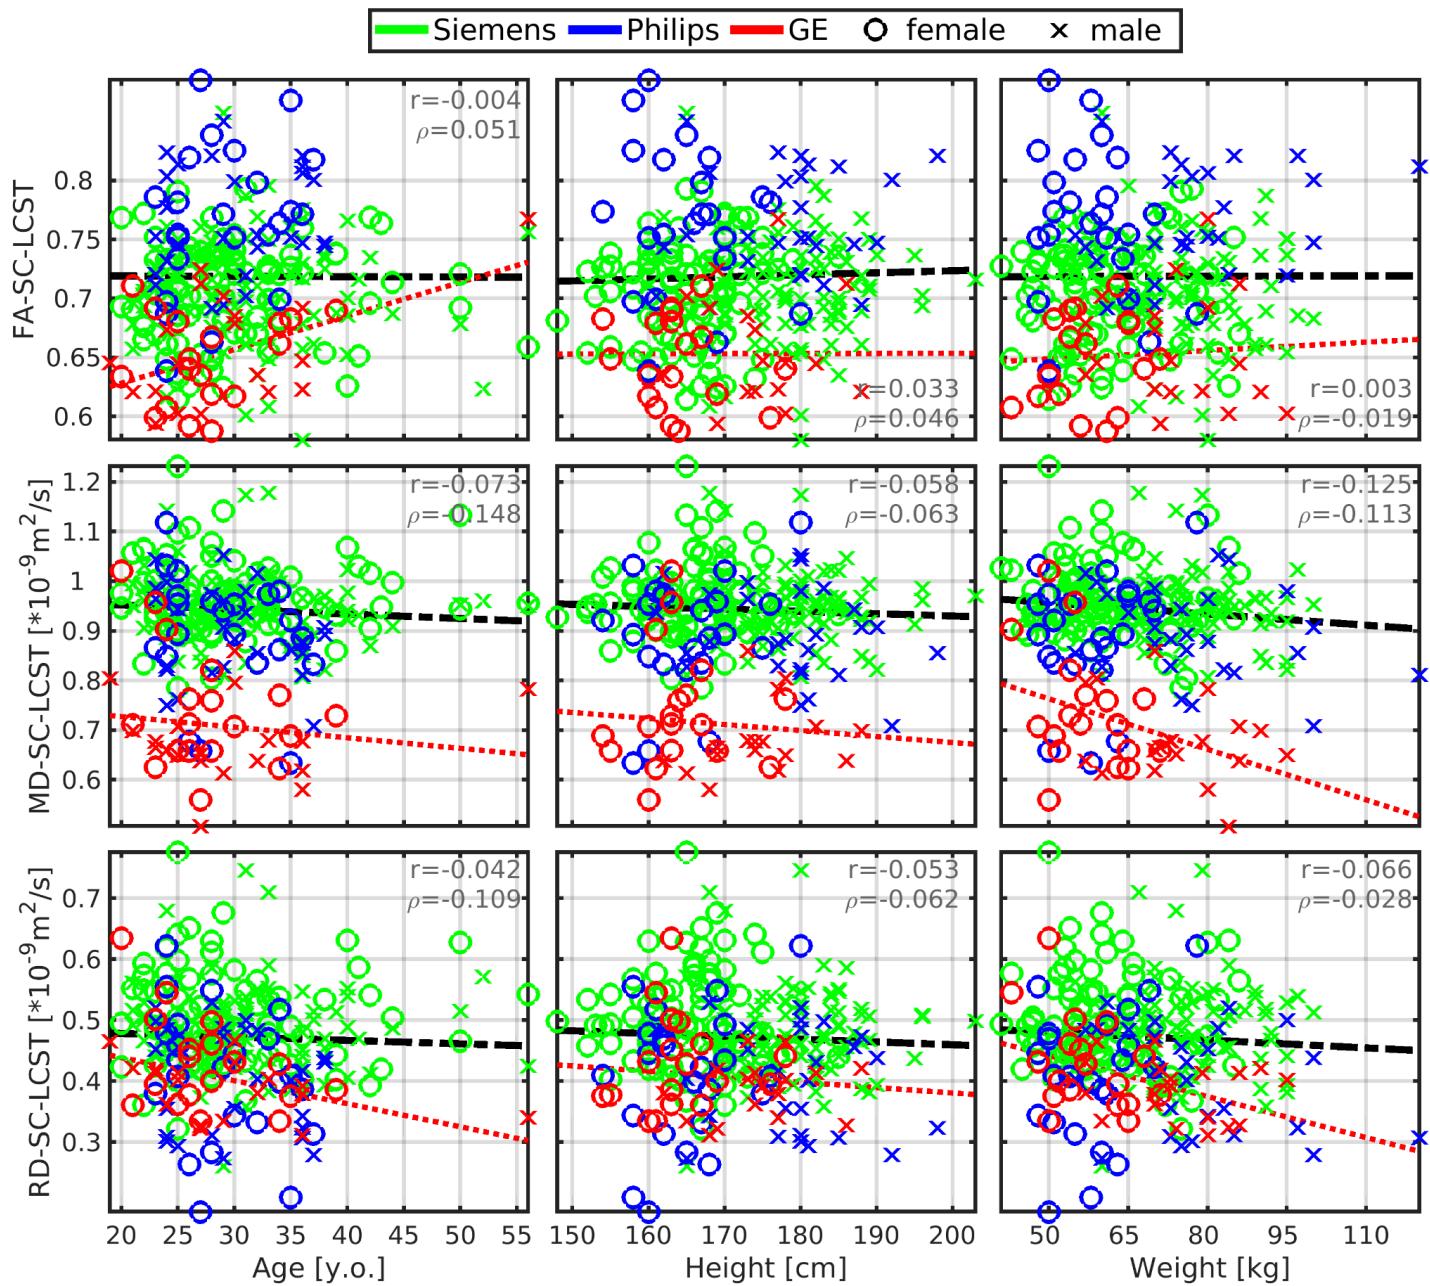

**Figure S2: Mean diffusivity in spinal cord (SC) dorsal columns (DC) is correlated to body weight.**

**Abbreviations:** DC - dorsal columns; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; RD - radial diffusivity;  $r$  - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. Plots with statistically significant correlation ( $p_{FWE} < 0.05$ ) are highlighted with yellow background, and corresponding  $r$  and  $\rho$  values are highlighted with black bold font.

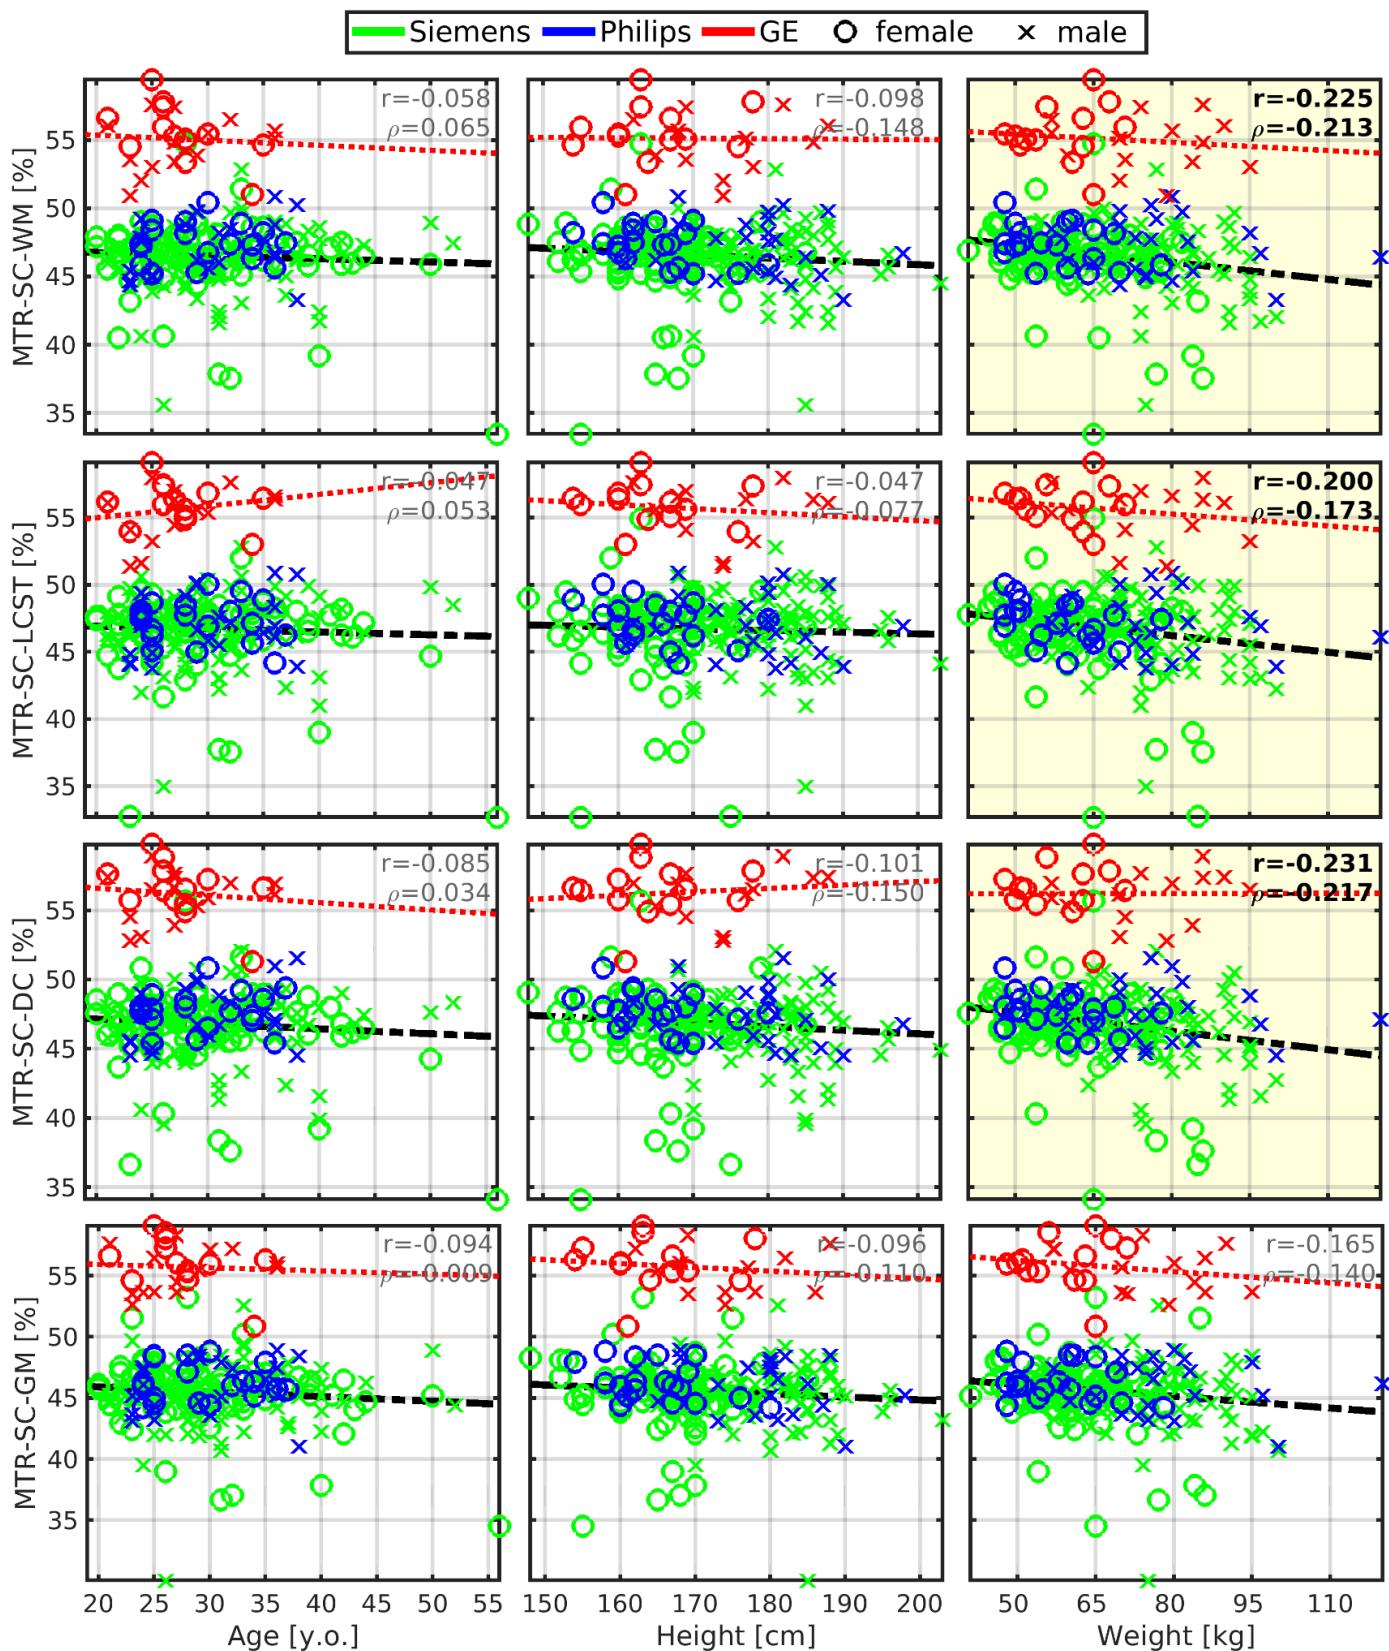

**Figure S3: No correlation between diffusion tensor imaging in spinal cord (SC) gray matter (GM) and body size or age respectively.**

Abbreviations: GM - gray matter; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; RD - radial diffusivity; r - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. No plotted correlations are significant ( $p_{FWE} < 0.05$ ).

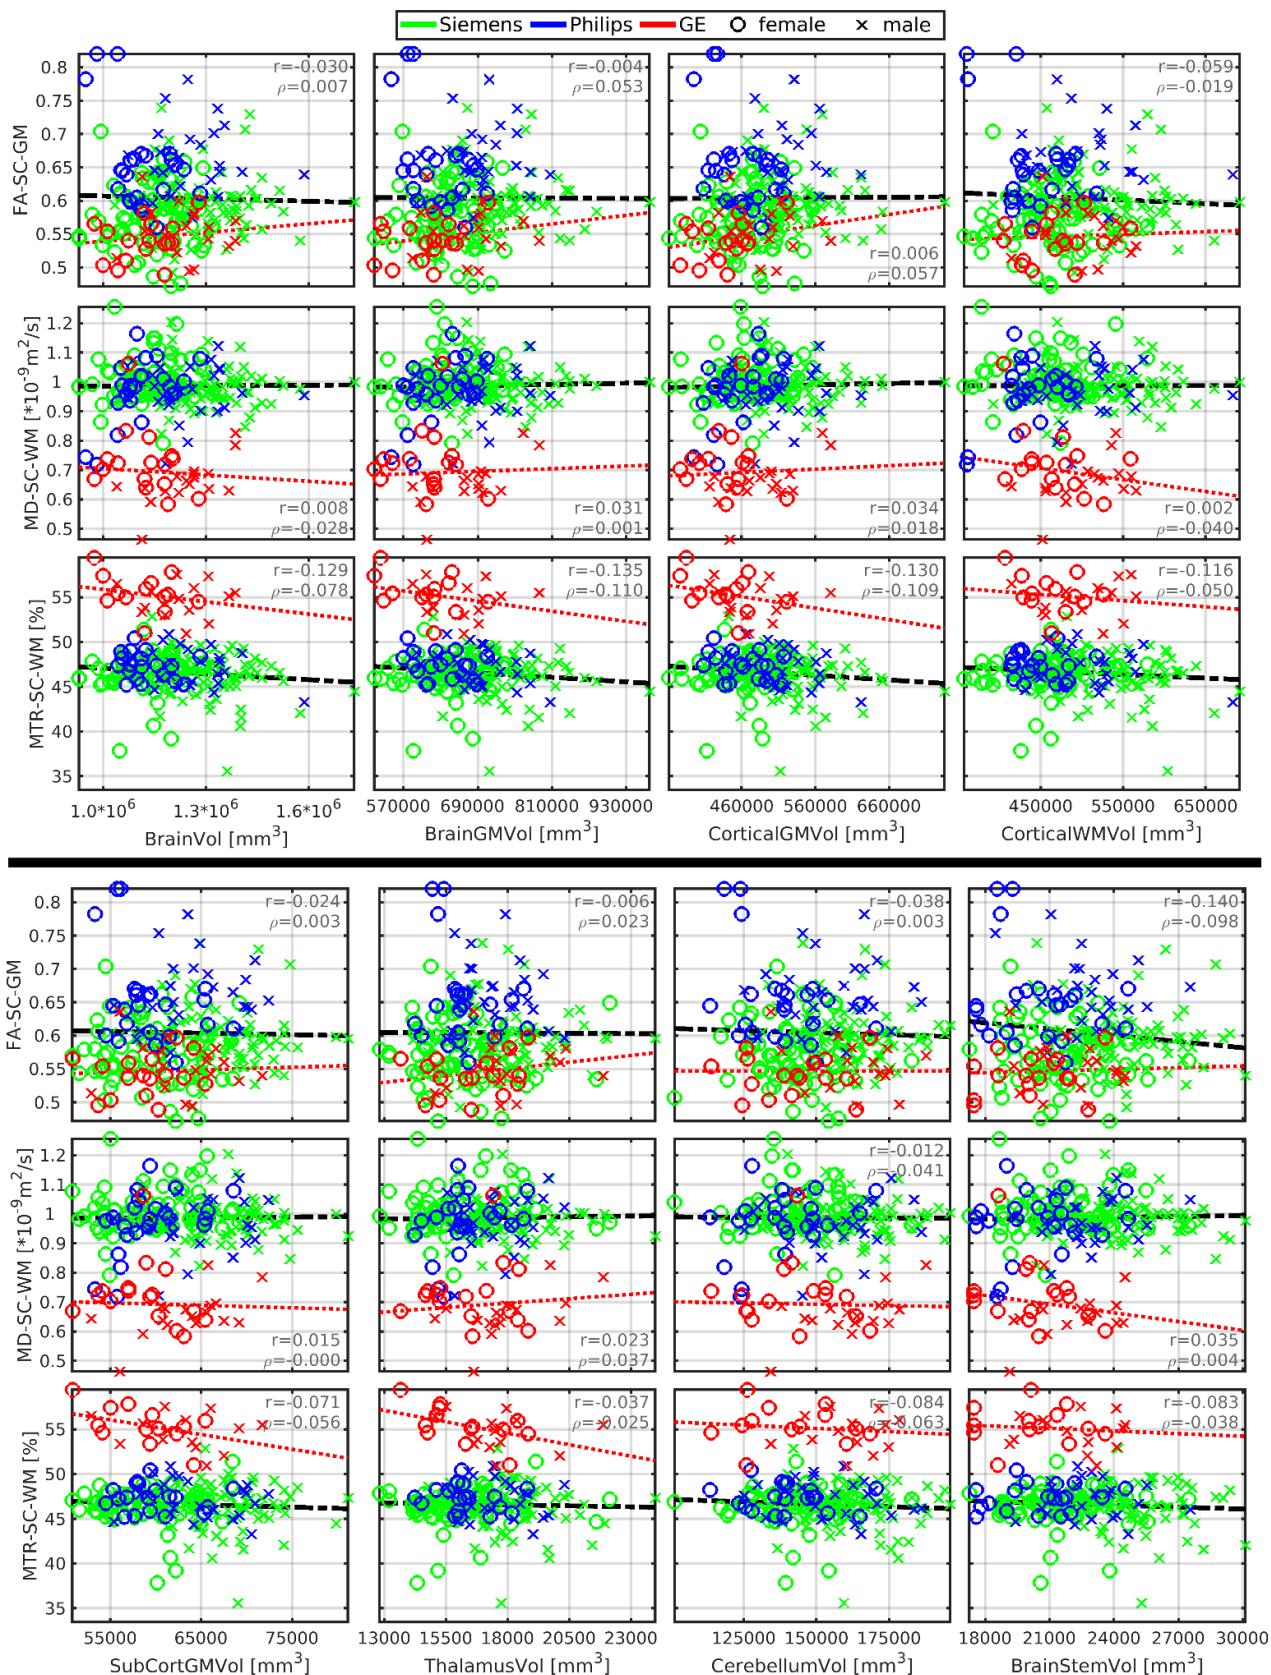

**Figure S4: No correlation between diffusion tensor imaging in spinal cord lateral corticospinal tracts (LCST) and body size or age respectively.**

**Abbreviations:** LCST - lateral corticospinal tracts; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; RD - radial diffusivity; r - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. No plotted correlations are significant ( $p_{\text{FWE}} < 0.05$ ).

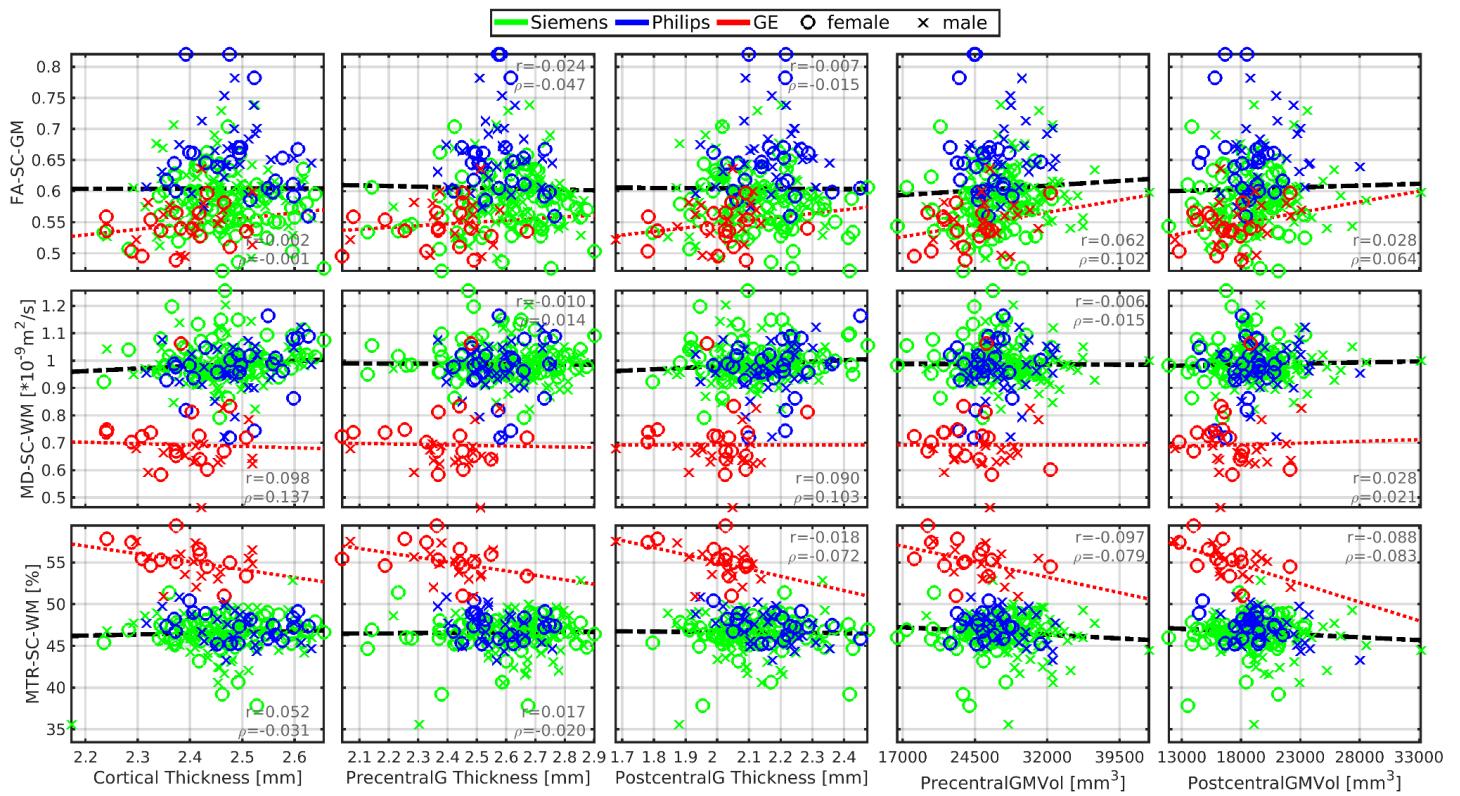

**Figure S5: Spinal cord magnetization transfer ratio imaging is correlated to body weight.**

Abbreviations: WM - white matter; SC - spinal cord; LCST - lateral corticospinal tracts; DC - dorsal columns; GM - gray matter; MTR - magnetization transfer ratio;  $r$  - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. Plots with statistically significant correlation ( $p_{\text{FWE}} < 0.05$ ) are highlighted with yellow background, and corresponding  $r$  and  $\rho$  values are highlighted with black bold font.

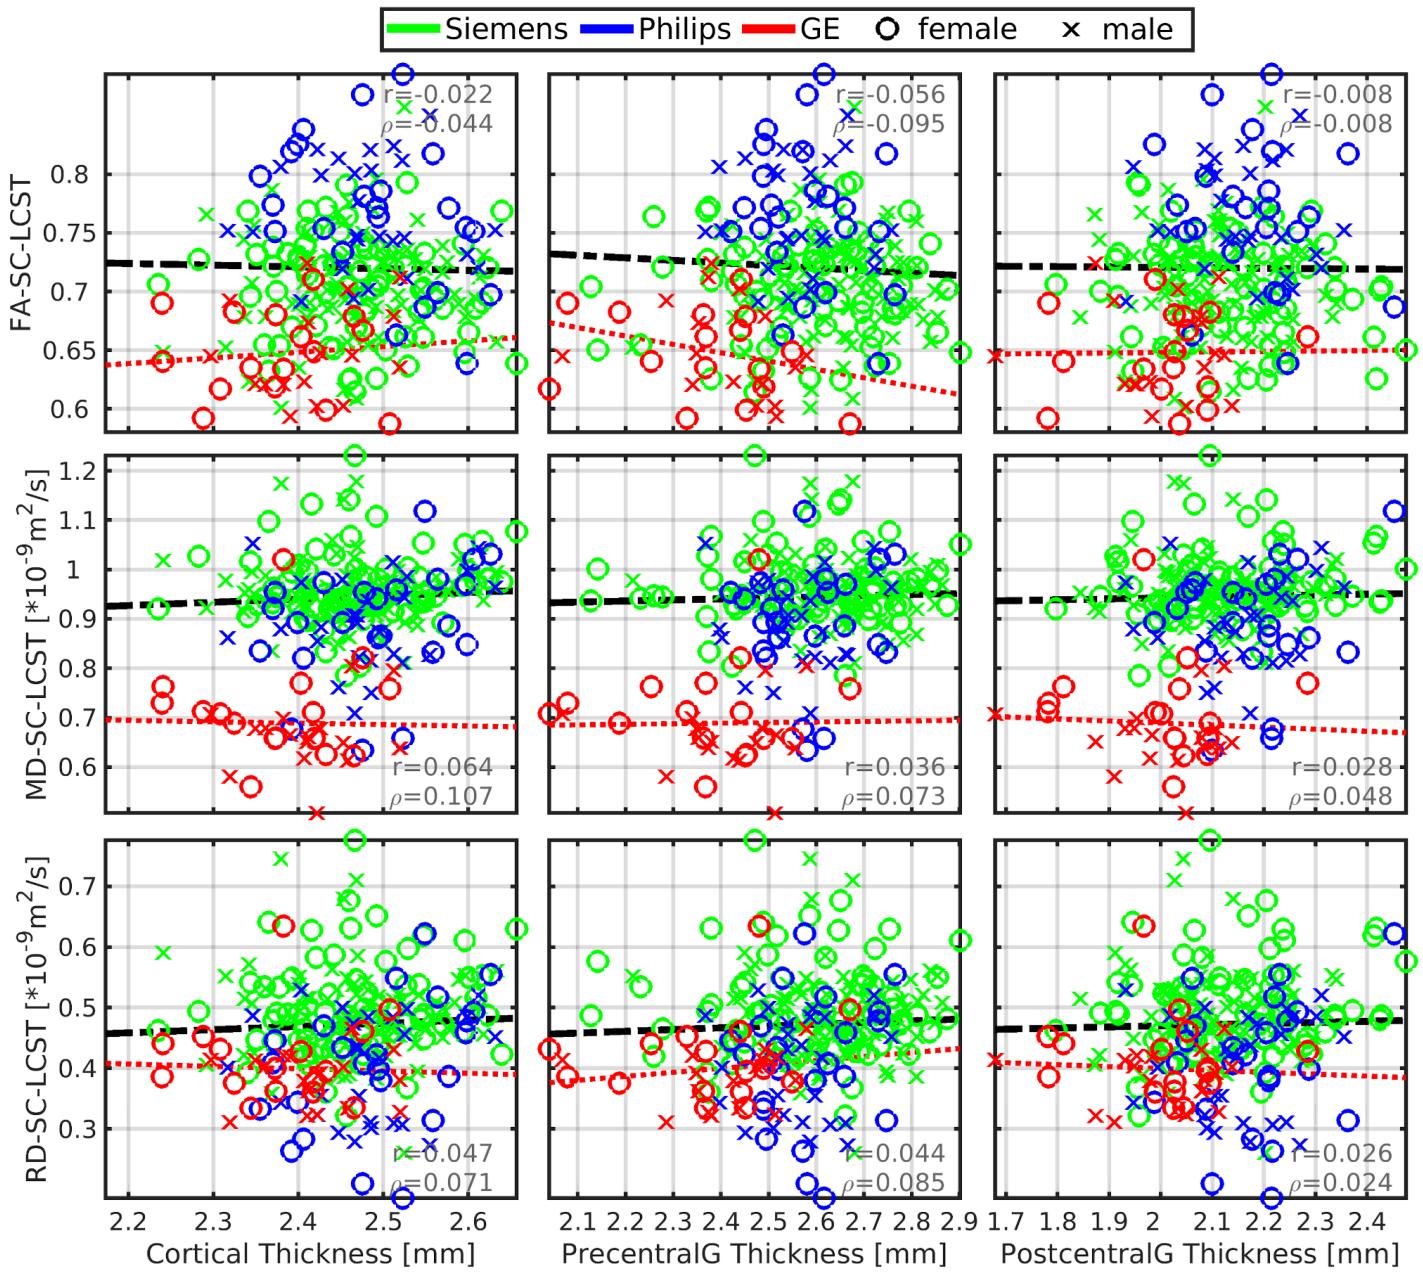

**Figure S6: No links between cerebral macrostructure (x-axis) and spinal cord microstructure (y-axis).**

**Abbreviations:** WM - white matter; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; MTR - magnetization transfer ratio; GM - gray matter; Vol - volume; SubCort - subcortical; r - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. Regression lines (i.e., the dashed black lines) were estimated from all available data points. No plotted correlations are significant ( $p_{\text{FWE}} < 0.05$ ).

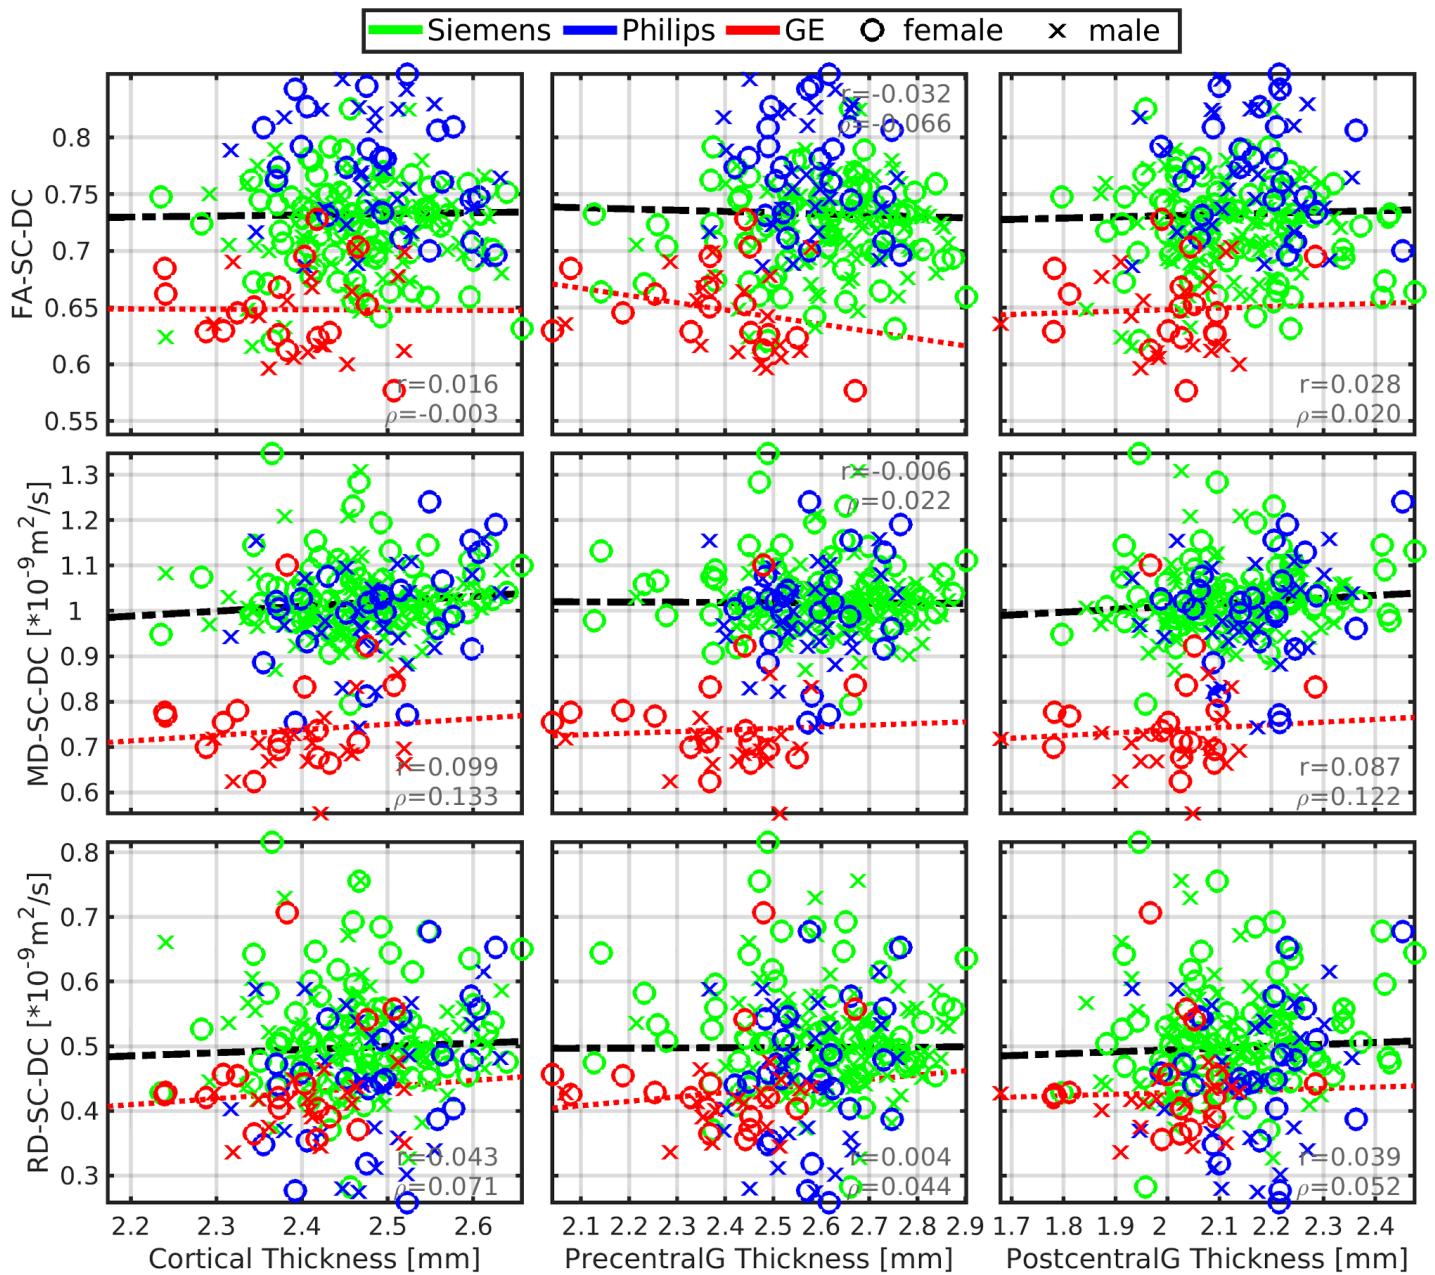

**Figure S7: No links between cortical macrostructure (x-axis) and spinal cord microstructure (y-axis).**

Abbreviations: WM - white matter; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; MTR - magnetization transfer ratio; GM - gray matter; Vol - volume; r - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. Regression lines (i.e., the dashed black lines) were estimated from all available data points. No plotted correlations are significant ( $p_{\text{FWE}} < 0.05$ ).

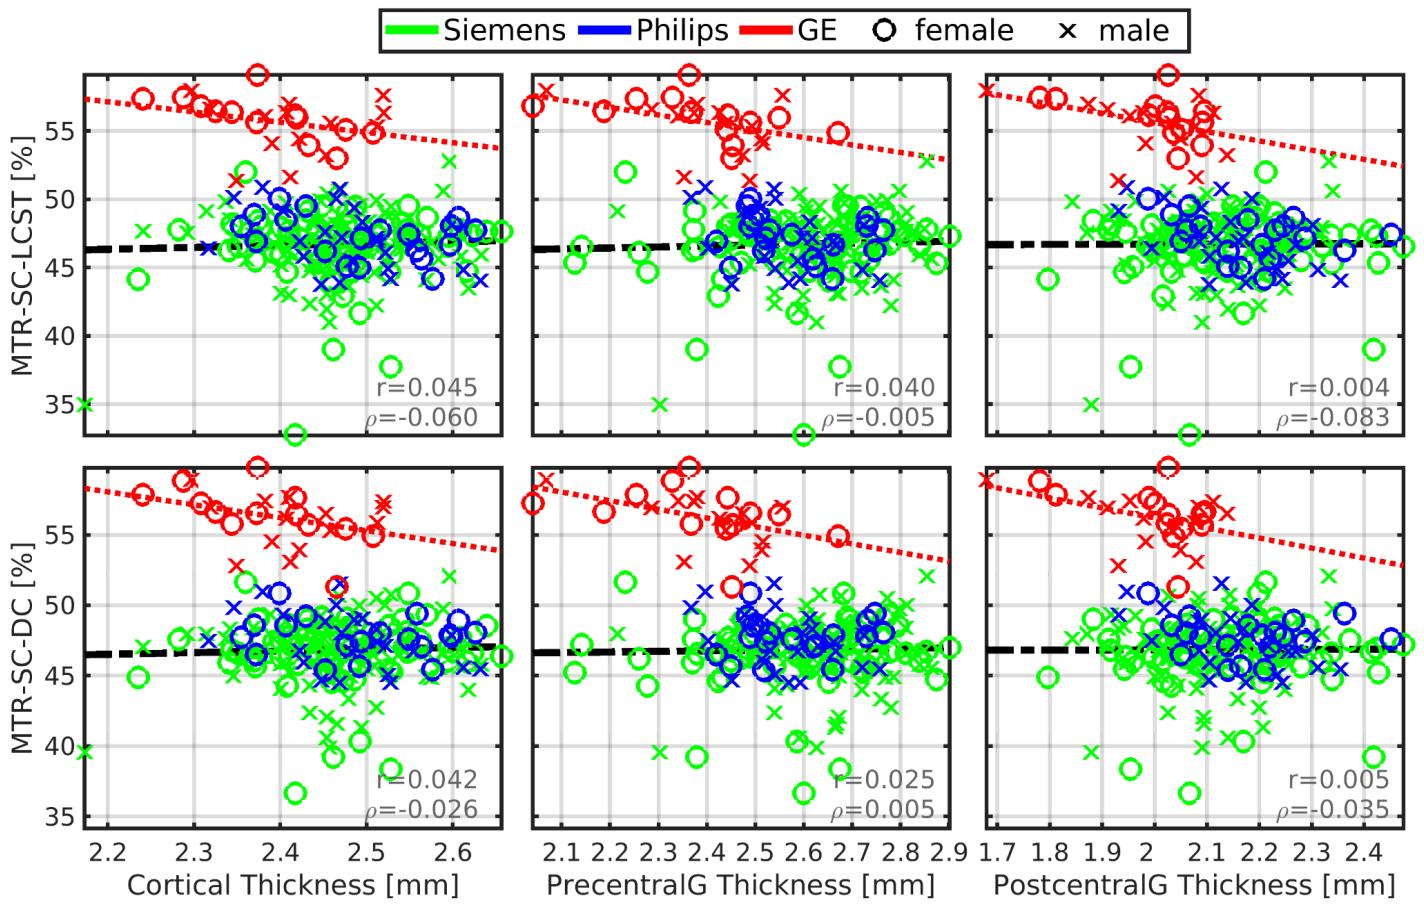

**Figure S8: No links between cortical thicknesses (x-axis) and spinal cord diffusion tensor imaging of bilateral lateral corticospinal tracts (y-axis).**

**Abbreviations:** LCST - lateral corticospinal tracts; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; RD - radial diffusivity; r - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. No plotted correlations are significant ( $p_{\text{FWE}} < 0.05$ ).

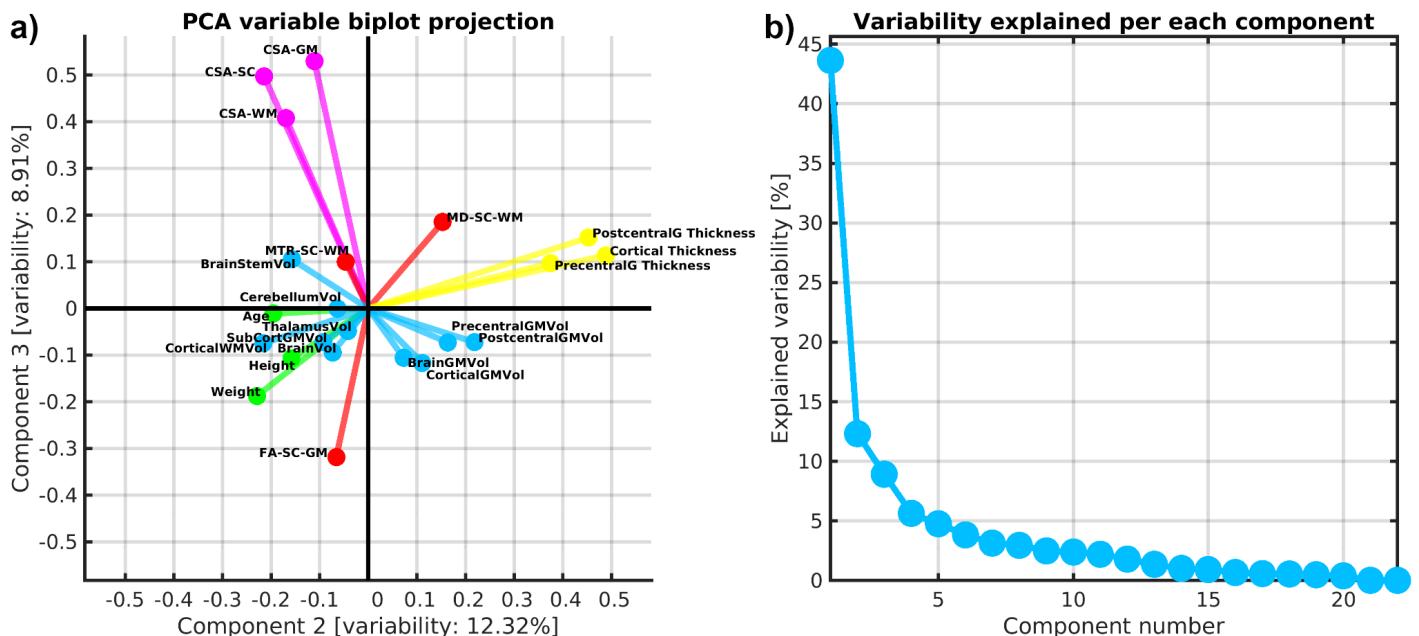

**Figure S9: No links between cortical thicknesses (x-axis) and spinal cord diffusion tensor imaging of bilateral dorsal columns (y-axis).**

**Abbreviations:** DC - dorsal columns; SC - spinal cord; FA - fractional anisotropy; MD - mean diffusivity; RD - radial diffusivity;  $r$  - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. No plotted correlations are significant ( $p_{\text{FWE}} < 0.05$ ).

**Figure S10: No links between cortical thicknesses (x-axis) and magnetization transfer ratio of bilateral lateral corticospinal tracts and bilateral dorsal columns (y-axis).**

Abbreviations: SC - spinal cord; LCST - lateral corticospinal tracts; DC - dorsal columns; MTR - magnetization transfer ratio;  $r$  - Pearson correlation coefficient;  $\rho$  - Spearman correlation coefficient. All spinal cord measurements were averaged from cervical C2-5 levels. Black dashed regression lines were estimated from the Siemens and Philips scanners' data points. Red dotted regression lines were estimated from the GE scanner's data points. No plotted correlations are significant ( $p_{\text{FWE}} < 0.05$ ).

**Figure S11: Biplot projection of 2<sup>nd</sup> and 3<sup>rd</sup> principal components (a) and explained data variability per principal component (b).**

**Supplementary Table 1: Full table of Pearson correlation coefficients (r) between body size, age, spinal cord structure, and brain structure, and post-hoc sex-effects in the correlation analysis.**

Abbreviations: CSA - cross-sectional area; SC - spinal cord; WM - white matter; GM - gray matter; Vol - volume.

The correlation p-values (p) are uncorrected. Table 2 in the main paper is a subset of this supplementary table. CSA was measured as averages between C3-C4 segments. DTI and MTR were calculated as averages between C2-C5 segments. The column denoted “Original values” reports correlation coefficients for raw measurements with no normalization procedure prior to the correlation analysis. The column denoted “Manufacturer-specific normalized SC measures” reports correlation coefficients for SC structural measurements, which were normalized to zero mean for each scanner manufacturer before correlation analysis. Empty cells in the right half of the table represent combinations where no updated correlation coefficients were measured, because the utilized normalization of SC structural measurements had no effect on these correlation coefficients. Brain structural measurements were not considered necessary to normalize as we did not observe strong scanner-related effects in brain macrostructural measurements.

Correlation pair	Original values						Manufacturer-specific normalized values
