

Supplemental Fig. 1: Micrograph of numbered chromosomes from a squash of a *Nma* root tip which confirms the presence of 48 chromosomes.

***Nicotiana* ×*mierata* Krügel, nothospec. nov.**

(≡ *Nicotiana miersii* J. Remy in C. Gay, Fl. Chil. 5: 56. 1849 [♀] × *N. torreyana* Nelson & J. F. Macbr. in Bot. Gaz. 61: 43, 1916 [♂])

Differt a *N. miersii* foliis rosulatis majoribus, ovalibus ad ovatis (non lanceolatis vel late lanceolatis), floribus seminibusque majoribus. Differt a *N. torreyana* foliis rosulatis latioribus margine magis undulantes, floribus limbo latiore cum sectionibus petalorum obtusis, colore seminum atro et odore typico foliorum *Nicotianae miersii*.

Typus: *Nicotiana* ×*mierata* F5, KA-nr.0605/04, plant 1, cultured 1L pot, leg. T. Krügel, 04. 08.2005. (JE).

Calculation of Mean Parent Values

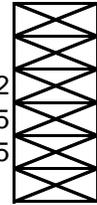

The average values of 3 lineages of *Nmi* for JA, alkaloid, phenolic, diterpene glycoside, and VOC concentrations (from Figures 5-10) were compared to the calculated mean of the two parental species *Nmi* and *Na* in order to assess whether *Nma* traits could be predicted as the average of its two parental species. The mean parent value is calculated as $(AVE_{Na} + AVE_{Nmi})/2$ and the standard deviation (SD) is $(SD_{Na}^2 + SD_{Nmi}^2)^{1/2}$. The mean parental value was compared to each of the 3 groups of *Nma* with an unpaired, 2-tailed, Bonferroni-corrected T-test. Corresponding T-values and P-values are shown for each comparison. Data is in appended table.
