Suppl. Fig. 2 Unspecific effects via differences in motility can be excluded.

H. pylori P12 and P12 Δ cagPAI were centrifuged onto MyD88/Trif^{-/-} BMMs for 5 min. and infected for further 40 min. The expression levels of the respective genes were tested by qRT-PCR. The ARE containing genes (A) TNFsf9 (B) TNF- α (C) IL-1 β were analyzed. Results obtained here are similar to the 60 min. infection time point. All experiments were performed in triplicates with at least three biologically independent experiments and are represented as mean + sem. * $p < 0.05$, ** $p < 0.01$
