

## SUPPLEMENT

**Figure S1.** Experimental setup: 4 *Arabidopsis* seedlings were either grown without *P. indica* (shown here) or on a 1 week-old *P. indica* fungal lawn (not shown because the fungal lawn prevents the detection of the roots on the picture). In each plate, two of the seedlings were inoculated with an *A. brassicae* spore suspension or mock-treated with water (red o), the other two remained untreated.
