General experimental information and synthesis

Solvents (p.a. or HPLC grade) were from VWR international (Merck). Oligosaccharides were purchased from Biosynth [2-O-(α-D-mannopyranosyl)-D-mannose, 3-O-(α-D-Mannopyranosyl)-D-mannose, 6'-sialyllactose sodium salt, 3'-sialyllactose sodium salt], Sigma-Aldrich (glucose, mannose, maltotriose, maltoheptaose) and Megazyme [4-O-(α-D-mannopyranosyl)-D-mannose, mannotriose, mannotetraose]. All commercially available substances were used without further purification.

Chromatographic Methods

- **Thin Layer Chromatography**
  Normal phase TLC was performed on regular silica gel 60 F254 (Merck Millipore). For TLC on reversed phase (RP), silica gel 60 RP-18 F254S (Merck Millipore) was used. Spots of compounds were detected by exposing TLC plates to UV-light (254 or 366 nm).

- **Column Chromatography**
  Flash chromatography (normal phase; regular silica gel) was performed on an automated Isolera™ One system (Biotage GmbH) or Interchim puriFlash™ flash purification system with commercially available cartridges. For isolation of the phosphorylated dyes, the preparative reversed phase column chromatography was applied (on POLYGOPREP® 60-50 C18; Macherey Nagel). For isolated of the dye – sugar conjugates (see Methods A and B below), flash chromatography (RP C18, 15C18AQ-F0025 cartridge, ACN – 20 mM TEAB, pH 8, 0–5% ACN, 15 column volumes) was applied.

- **High-Performance Liquid Chromatography (HPLC)**
  Analytical HPLC system: Azura (Knauer) with 10 mL pump-heads and diodes array detection (DAD 6.1L). Analytical column: Eurospher-100 C18, 5 µm, 150x4 mm, 1.2 mL/min (if not stated otherwise), Kinetex C18 100, 5 µm, 250x4 mm, 1.2 mL/min, or Interchim Uptisphere C18-HQ, 10 µm, 250x4.6 mm, 1.2 mL/min. Solvent A: water + 0.1% v/v trifluoroacetic acid (TFA); solvent B: MeCN + 0.1% v/v TFA (if not stated otherwise). Preparative columns: Kinetex C18 100, 5 µm, 250x20 mm; Interchim Uptisphere Strategy C18-HQ, 10 µm, 250×21 mm. For isolation and purification of phosphorylated dyes and
their conjugates, acetonitrile – aqueous systems containing 0.05 – 0.1 M of Et$_3$N$^+$H$_2$CO$_3$ buffer (pH = 8, self-prepared from 1 M aq. Et$_3$N and CO$_2$ gas obtained by evaporation of solid CO$_2$) were used.

### Analytical instruments

- **Absorption Spectroscopy**
  Absorption spectra were recorded with a double-beam UV–vis spectrophotometer (Varian 4000) in quartz cuvettes with a 1 cm path length. Emission spectra were recorded on a Cary Eclipse fluorescence spectrometer (Varian). Fluorescence quantum yields (absolute values) were obtained on a Quantaurus-QY Absolute PL quantum yield spectrometer C11347 (Quantaurus QY). Excited states lifetimes were measured with Quantaurus-Tau device with TDC Unit M12977-01 (Hamamatsu).

- **Nuclear Magnetic Resonance (NMR)**
  NMR spectra were recorded at 25 °C with an Agilent 400-MR spectrometer at 400.1 MHz (\(^1\)H), 376.4 MHz (\(^19\)F), 161.9 MHz (\(^31\)P) and 100.6 MHz (\(^{13}\)C) and are reported in ppm. All \(^1\)H spectra are referenced to tetramethylsilane (\(\delta = 0\) ppm) using the signals of the residual protons of HDO (4.79 ppm) in D$_2$O, CHD$_2$OD (3.31 ppm) in CD$_3$OD, CHD$_2$COCD$_3$ (2.05 ppm) in (CD$_3$)$_2$CO, CHD$_2$CN (1.94 ppm) in CD$_3$CN, DMSO-d$_6$ (2.50 ppm) in DMSO-d$_6$, CHCl$_3$ (7.26 ppm) in CDCl$_3$. Multiplicities of the signals are described as follows: s = singlet, br. s = broad singlet, d = doublet, dd = doublet of doublets, t = triplet, q = quartet, m = multiplet. Coupling constants (\(J, nJ_{x,y}\)) are given in Hz, where \(n\) is the number of bonds between the coupled nuclei \(x\) and \(y\). \(^{13}\)C NMR spectra were also acquired with an INOVA 500 spectrometer (Brucker). \(^{13}\)C spectra are referenced to tetramethylsilane (\(\delta = 0\) ppm) using the signals of the solvent: CD$_3$CN (1.32 ppm), CD$_3$OD (49.00 ppm), (CD$_3$)$_2$CO (29.84 ppm), DMSO-d$_6$ (39.52 ppm), CDCl$_3$ (77.36 ppm). If \(^{13}\)C-signals were revealed by indirect detection by HSQC (Agilent 400MR DD2 spectrometer), only resonances of the protonated carbon atoms atoms were visible.

- **Mass-Spectrometry (MS)**
  Low resolution mass spectra (50 - 3500 m/z) with electro-spray ionization (ESI) were obtained on a Varian 500-MS spectrometer. High resolution mass spectra (ESI-HRMS) were obtained on a Bruker micro TOF (ESI-TOF-MS) spectrometer.
**Electrophoresis (general conditions)**

Ca. 2 nmol of each dye and its conjugates (1 nmol for mannobioses’ isomers) was dissolved in 15 µL of ultrapure water, mixed with an equal volume of loading solution (80% formamide, 52 mM EDTA, 89 mM Tris, 89 mM boric acid) and separated on a denatured 20% polyacrylamide gel (7 M urea). The dyes and sugar-dye-conjugates were detected under UV-light of 366 nm. For further details, see section “Reductive amination of sugars”.

Benzyl N-(2-hydroxyethyl) methylcarbamate \(^1\) (1)

Benzylchloroformate (1.2 eq, 13.7 g, 81 mmol) and triethylamine (11 mL, 81 mmol) were sequentially and dropwise added at 0 °C to a solution of 2-(methylamino)ethanol (5.0 g, 67 mmol) in dry DCM (150 mL). The cooling bath was removed, and the reaction mixture was stirred overnight at r. t. The reaction mixture was washed with water (2 × 50 mL), brine, and the organic solution was dried over MgSO\(_4\) and concentrated in vacuo. TLC (SiO\(_2\)): \(R_f = 0.25\) (EtOAc/hexane = 1:1). The title compound was isolated by column chromatography on SiO\(_2\), eluting with 50% EtOAc–hexane to provide 11.2 g of 1 as a white-yellow solid (yield 80%).

\(^1\)H NMR (400 MHz, CDCl\(_3\)): \(\delta 7.39 - 7.28\) (m, 5H), 5.12 (s, 2H), 3.74 (br. s, 2H), 3.44 (t, \(J = 5.4\) Hz, 2H), 2.99 (s, 3H) ppm.

\(^13\)C NMR (101 MHz, CDCl\(_3\)): \(\delta 136.7, 128.6, 128.1, 127.9, 67.4, 61.2, 52.0, 35.4\) ppm.

Benzyl N-[di(t-butoxy)phosphoryl]oxy)ethylmethylcarbamate\textsuperscript{2} (2)

Tetrazole (0.45 M solution in CH\textsubscript{3}CN, 45 mL, 20 mmol) and di-\textit{t}-butyl \textit{N},\textit{N}-diisopropylphosphoramidite (5.3 mL, 15 mmol) were added to a solution of 1 (2.1 g, 10.0 mmol) in THF (50 mL) under Ar, and the mixture was stirred at r. t. for 3 h. HPLC indicated that the starting material was consumed. The mixture was cooled to 0 ºC, and H\textsubscript{2}O\textsubscript{2} (70% aqueous, 8.0 mL) was added. After 30 min, an aqueous solution of Na\textsubscript{2}SO\textsubscript{3} (10%, 50 mL) was added with cooling in an ice bath. Organic solvents were removed under reduced pressure, and the residue was extracted with EtOAc (3 × 50 mL). The combined organic solutions were washed with brine, dried over MgSO\textsubscript{4}, and evaporated. The residue was subjected to column chromatography on SiO\textsubscript{2} (50 g); elution with 50% EtOAc–petroleum ether provided 2.36 g of 2 as a colorless oil (yield 59%).

\textsuperscript{1}H NMR (400 MHz, CD\textsubscript{3}CN) δ 7.41 – 7.26 (m, 4H), 5.09 (s, 2H), 4.04 – 3.93 (m, 2H), 3.54 – 3.45 (m, 2H), 2.94 (d, J = 10.2 Hz, 3H), 1.42 (s, 18H) ppm.

\textsuperscript{13}C NMR (101 MHz, CD\textsubscript{3}CN) δ 138.3, 129.4, 128.8, 128.7, 83.0, 82.9, 67.6, 67.5, 30.1, 30.0, 29.7, 19.4 ppm.

\textsuperscript{31}P NMR (162 MHz, CD\textsubscript{3}CN) δ -9.97 ppm.

2-(methylamino)ethyl di(\textit{t}-butyl)phosphate\textsuperscript{2} (3)

![Chemical structure](image)

A Schlenck flask was charged with a stirring bar, Pd/C (10% wt, 0.12 g, VWR International, oxidized form) was added followed by MeOH (10 mL). The flask was closed with a septum, flushed with argon (outlet through the septum via cannula) and then filled with hydrogen supplied from a balloon attached to the side arm of the flask. After stirring for 30 min, a solution of 2 (1.2 g, 3.0 mmol) in MeOH (10 mL) was added to a Schlenck-flask charged with hydrogen-activated Pd/C (10% wt, 0.12 g) suspended in MeOH. The reaction mixture was stirred at r. t. overnight under hydrogen. The reaction mixture was

thoroughly flushed with argon (with stirring) and transferred into centrifugation tubes. The catalyst was removed by centrifugation, washed with MeOH, and the combined organic solutions were evaporated in vacuo to afford 800 mg of 5 (84% yield) as a colorless oil.

8-Amino-1,3,6-pyrenetrisulfonyl trichloride (4)

Trisodium salt of 8-aminopyrene-1,3,6-trisulfonic acid (APTS)\(^3\) (446 mg, 0.98 mmol) was introduced into a 10 mL flask, cooled to 0 °C in an ice bath, and then chlorosulfonic acid (8.5 mL, 0.12 mol) was added dropwise with stirring. The reaction mixture was stirred at r. t. for 4 h, cooled to 0 °C, and carefully transferred onto crushed ice (100 g). The red precipitate of trisulfonyl chloride was washed with ice water (3 × 50 mL) and centrifuged. The crude compound was freeze-dried to afford 437 mg of 4 (87% yield) as a dark-red powder. The flask was purged with Ar and kept in the freezer (-20 °C).

8-Amino-[[N,N',N''-tris(2-hydroxyethyl)-N,N',N''-trimethyl]pyrene-1,3,6-trisulfonamide]-O,O',O''-triphosphate hexakis tert-butyl ester (6-\textsuperscript{t}Bu)

8-aminopyrene-1,3,6-trisulfonyl trichloride 4 (52 mg, 0.10 mmol) was added to a solution of 2-(methylamino)ethyl di(t-butyl)phosphate 5 (0.6 mmol, 160 mg) and triethylamine (0.14 mL, 1.0 mmol) in acetonitrile (2 mL) under Ar. The reaction mixture was stirred at r. t. overnight and concentrated in vacuo. The title compound was isolated by flash chromatography on SiO\textsubscript{2} (SNAP “Ultra” cartridge with 50 g SiO\textsubscript{2}, DCM/MeOH with 2-20% MeOH gradient over 13 CV) to afford 96 mg of 6-\textsuperscript{t}Bu (80% yield) as a brown-orange solid.

8-Amino-[N,N',N''-tris(2-hydroxyethyl)-N,N',N''-trimethylpyrene-1,3,6-trisulfonamide]-O,O',O''-triphosphate triethylammonium salt (6-H).

Method C:

Ester 6-\textsuperscript{t}Bu (96 mg, 80 \(\mu\)mol) was dissolved in dichloromethane (1.0 mL), the solution cooled to +5°C in an ice bath, and then TFA (1.0 mL) was added slowly with stirring. The reaction mixture was allowed to warm-up to r. t. and stirred for 1 h. The volatile materials were removed in vácuo, the residue was co-evaporated with dichloromethane (3 times)
and kept in vacuo (0.1 mbar) for 2 h. The residue was treated and stirred with 1 M aq. 
Et₃N⁺H₂CO₃ buffer (TEAB; pH = 8-9), until the pH stabilized at 8-9. The title compound 
was isolated by preparative HPLC (see below in Method D). Yield – 89 mg (82%) of the 
title compound (6-H) as hexakis triethylammonium salt.

Method D:
Dye 7-H (19 mg, 30 µmol) was dissolved in (MeO)₃PO (0.1 mL), and freshly distilled 
POCl₃ (131 µL, 1.4 mmol) in (MeO)₃PO (0.1 mL) was added with stirring at r. t. A weak 
exothermic reaction was observed, and the solution turned orange-brown. The reaction 
mixture was stirred for 3 h at r. t. All volatile components were removed in vacuo, and the 
residue was further dried by in vacuum (0.02 mbar). The residue was treated and stirred 
with 1 M aq. TEAB buffer (pH = 8-9). Fresh portions of the TEAB buffer were added, when 
the solution became acidic, until the pH stabilized at 8-9. The title compound was isolated 
by preparative HPLC using 0.1 M TEAB buffer (pH 8.5–9) as an eluent and a Kinetex 
column. Analytical HPLC: Kinetex, 5 µm C18 100, 25 cm, 4.6 mm, ACN/H₂O: 10/90 – 
30/70 in 20 min, 1.2 mL/min; tᵣ = 10.8 min. Freeze-drying of the eluate gave 5 mg of tetra-
triethylammonium salt of the title compound as orange crystals. Yield 16%.

8-Methylamino-$N,N',N''$-tris(2-hydroxyethyl)-$N,N',N''$-trimethylpyrene-1,3,6-trisulfonamide (7-Me)

The title compound was obtained from trifluoroacetate 8 (25 mg, 34 µmol) upon treatment with 1 M aq. NaOH diluted with methanol (ca. 1:1), so that the reaction mixture remained homogeneous. The course of the reaction was monitored by TLC on regular SiO$_2$ (for solvent systems, see below). The product was isolated as an orange solid (20 mg, 95% yield) by chromatography on SiO$_2$ using a 15:1 mixture of DCM and methanol as an eluent.

8-[N-methyl-N-(trifluoroacetyl)]amino-$N,N,N''$-tris(2-hydroxy-ethyl)-$N,N,N''$-trimethylpyrene-1,3,6-trisulfonamide (8)

Compound 7-H (177 mg, 0.28 mmol) was suspended in 10 mL of anhydrous DCM, and a 10% solution of trifluoroacetic anhydride in DCM ($d = 1.33$ g/mL, 1.8 mL, $\sim$1.2 mmol) followed by Et$_3$N (250 µL, $d = 0.73$ g/mL, 1.8 mmol) was added at r. t. The reaction mixture was stirred for 30 min (with control by TLC). All volatile materials were evaporated under reduced pressure, the residue was co-evaporated with acetonitrile (3 times), dissolved in methanol (50 mL), and NaHCO$_3$ (50 mg) was added. These operations remove trifluoroacetate groups from hydroxyl groups. After stirring at r. t. for 30 min, TLC displayed the full conversion into intermediate 7-COCF$_3$. The reaction mixture was neutralized with acetic acid, and all volatile materials removed in vacuo. The title compound was isolated by chromatography on SiO$_2$ (50 g), using CH$_2$Cl$_2$/acetone (2:1) as an eluent. Yield – 165 mg (82%) of 7-COCF$_3$ as a yellow solid. To a solution of POCl$_3$ (74 mg, 0.48 mmol) in 0.1 mL of (MeO)$_3$PO, the solution of compound 8 (40 mg, 54 µmol) in 0.5 mL of (MeO)$_3$PO was added dropwise at 0°C. Then the reaction mixture was stirred for 1.5 h at r. t. All volatile materials (excess of POCl$_3$ and most of trimethyl phosphate) were removed in vacuum (using rotary evaporator and then an oil pump; 0.5 mbar, 60 °C, cold trap cooled with dry ice for collecting distillate). The residue was treated and stirred with 1 M Et$_3$N$^+$H$_2$CO$_3$ buffer (TEAB; initial pH = 8-9) and pH-value was controlled. Fresh portions of the TEAB buffer were added when the solution became acidic, until the pH-value stabilized at about 6–7. The cleavage of trifluoroacetyl protecting group takes place under basic conditions in aq. TEAB. Then the reaction was complete (HPLC indicated no changes), the mixture was loaded on RP-18 (ca. 30 g) and the title compound was eluted using 1:4 mixture of MeCN and aqueous 0.1 M Et$_3$N$^+$H$_2$CO$_3$ buffer (pH 8) to afford 30 mg of 9 as a red solid (51% yield). Compound 11 (75 mg, 0.13 mmol) was suspended in dry DMF (0.1 mL) under argon, Cs₂CO₃ (55 mg, 0.17 mmol) was added followed by MeI (0.15 mL). The reaction mixture was stirred for 1 h in a screw-cap tube at 50 °C. HPLC indicated that the reaction was complete. HPLC: starting material tᵣ = 13.7 min, product tᵣ = 15.8 min (MeCN/H₂O 30:70 → 100:0 + 0.1% TFA in 25 min detected at 254 nm). DMF was removed in vacuum, and the residue was taken up in dichloromethane – water mixture. The organic layer was separated, washed with brine, dried over sodium sulfate, filtered and evaporated in vacuo. The N-methylated product (56 mg, 72 %) was isolated by chromatography on SiO₂ (25 g) in the course of elution with 0 – 5% MeOH in ethyl acetate.

solution in DMSO) were added. The samples were shaked at 40 °C for 1 h in an Eppendorf ThermoMixer®, and solvents were completely removed in a freeze-dryer (Martin Christ, residual pressute <0.1 mbar, temp. of the cooling coil –80°C: step 1). A solution of 2-picoline-borane complex (10 eq, 10 µL of 1 M solution in DMSO) was added, and the samples were stirred at 40°C for 16 h in an Eppendorf ThermoMixer® (step 2). The products were isolated either by flash chromatography (RP C18, 15C18AQ-F0025 cartridge, ACN – 20 mM TEAB, pH 8, 0–5% ACN, 15 column volumes, Interchim puriFlash™), or by preparative HPLC with UV-VIS detection (MeCN (A)/TEAB 0.05 M in water (B), 5:95 → 30:70 in 20 min detected at 500 nm; columns: Kinetex C18 100, 5 µm, 250x20 mm, or Interchim Uptisphere Strategy C18-HQ, 10 µm, 250×21 mm, flow rate 20 mL/min). The constitutions of the products (see structures below) were confirmed by ESI-HRMS.

Method A worked fine for all saccharides, except 3'- and 6'-sialyllactoses. In these two cases, the reductive amination of was only possible by using Na(CN)BH₃ in THF and aqueous citric acid (see Method B below).

In Method A, the Schiff’s base was formed in the presence of malonic acid (pKₐ 2.83) and then reduced by 2-picoline borane complex.

The formation of the Schiff’s base (Scheme S3) was observed by HPLC analysis only after complete drying of the reaction mixture (step 1); when 2-picoline-borane complex was not yet added (Figure S2). The absorption maximum of the Schiff’s base is blue-shifted to 459 nm (dye 6-H: 472 nm, conjugate with glucose 496 nm). In this experiment, the Schiff base was isolated and its constitution confirmed by ESI-MS. These observations explain the necessity of complete removal of water by drying in vacuo, before addition of reducing agent.

---

**Scheme S3.** Reductive amination of glucose

**Figure S2.** Step 1: dye 6-H, glucose and malonic acid were mixed and shaken at 40 °C for 1 h. Then the reaction mixture was dried. Starting material ($t_R = 10.3, \lambda_{\text{max}} = 474\text{ nm}$, magenta line, last spectrum) and Schiff base ($t_R = 8.8, \lambda_{\text{max}} = 459\text{ nm}$, dark blue line, first spectrum) were observed.
Figure S3. Step 2: 2-picoline-borane complex was added and the reaction mixture was shaken at 40 °C for 16 hours. Only traces of the starting material ($t_R = 10.7$ min, $\lambda_{\text{max}} = 471$ nm, brown line) and Schiff base ($t_R = 9.3$ min, $\lambda_{\text{max}} = 461$ nm, dark blue line) were observed. The main peak with $t_R = 10.2$ min represents the desired product ($\lambda_{\text{max}} = 496$ nm, green line).

Method B:

1.5 mL Eppendorf tube was charged with dye (10 µL of 0.1 M solution in water), sugar (5 eq, 50 µL of 0.1 M solution in water), citric acid (10 eq, 10 µL of 1 M solution in water) and NaBH₃CN (10 eq, 10 µL of 1 M solution in THF) were added. The samples were shaked at 60 °C overnight. The products were isolated by RP chromatography (see Method A above), and their constitutions (see structures below) were confirmed by ESI-HRMS.

The product yields were determined by HPLC, by measuring peak areas of the residual dyes and products in the reaction mixtures at isosbestic points (APTS/APTS+G – 440 nm, 6-H/6-H+G – 484 nm, 16/16+G – 487 nm), as exemplified in Figure S4.

**Figure S4.** HPLC analysis of the reductive amination of 6-H with maltoheptaose ($G_7$) showed the conversion to glycoconjugate (detection at the isosbestic wavelength of 484 nm).

Free dyes (APTS, 6-H and 16 in Scheme S1) and their conjugates with sugars were analyzed by PAGE. Samples were applied to a 20% (w/v) polyacrylamide slab gel (0.7 mm x 230 mm x 300 mm) in TBE buffer (pH 8). The electrophoresis was performed at ambient temperature and constant power (35 W; 1750 - 2200 V) for 90 min. The bands were visualized by emission (excitation with 366 nm UV-lamp), and the pictures (Figure 2 in the main text, and Figures S5-S6) were taken by using a digital camera.

**Figure S5.** Gel electrophoresis results (migration from “north” to “south”, pH 8.3). For structures, see Scheme S1 and the previous section (Characterization of Conjugates). Left (reference) lane (from bottom to top): APTS (lowest bluish band), APTS+G, APTS+G₃ and APTS+G₇; right lane (from bottom to top): dye 6-H, 6-H+G, 6-H+G₃, 6-H+G₇ (yellow bands). Spots were detected by emission (excitation at 365 nm).
Figure S6. Gel electrophoresis of APTS conjugates with mannose and its oligomers (left part, green spots) and conjugates of dye 16 with mannose and its oligomers (right part, yellow spots); migration from “north” to “south”, pH 8.3. For structures, see Scheme S1 and the previous section (Characterization of Conjugates). Left part, green spots, from left to center: APTS+M, APTS+M$_2$-2O, APTS+M$_2$-3O, APTS+M$_2$-4O, APTS+M$_3$ and APTS+M$_4$. Right part, yellow spots, from center to right: 16+M, 16+M$_2$-4O, 16+M$_2$-2O, 16+M$_2$-3O, 16+M$_3$ and 16+M$_4$. Bands were detected by emission (excitation at 365 nm).

Note that APTS+M$_2$-2O moves a bit slower than APTS+M$_2$-3O, 16+M$_2$-2O and 16+M$_2$-4O are undistinguishable, APTS+M$_2$-4O moves much slower than other dimers, 16+M$_2$-3O moves faster than 16+M$_2$-2O or 16+M$_2$-4O.
